

Industrial Router Lite Series

UR32L

User Guide

Preface

Thanks for choosing Milesight UR32L industrial cellular router. The UR32L industrial cellular router delivers tenacious connection over network with full-featured design such as automated failover/failback, extended operating temperature, hardware watchdog, VPN, Fast Ethernet and beyond.

This guide describes how to configure and operate the UR32L industrial cellular router. You can refer to it for detailed functionality and router configuration.

Readers

This guide is mainly intended for the following users:

- Network Planners
- On-site technical support and maintenance personnel
- Network administrators responsible for network configuration and maintenance

© 2011-2026 Xiamen Milesight IoT Co., Ltd.

All rights reserved.

All information in this user guide is protected by copyright law. Whereby, no organization or individual shall copy or reproduce the whole or part of this user guide by any means without written authorization from Xiamen Milesight IoT Co., Ltd.

Safety Precautions

Milesight will not shoulder responsibility for any loss or damage resulting from not following the instructions of this operating guide.

- ❖ The device must not be disassembled or remodeled in any way.
- ❖ To avoid risk of fire and electric shock, do keep the product away from rain and moisture before installation.
- ❖ Do not place the device where the temperature or humidity is below/above the operating range.
- ❖ The device must never be subjected to drops, shocks or impacts.
- ❖ Make sure the device is firmly fixed when installing.
- ❖ Make sure the plug is firmly inserted into the power socket.
- ❖ Do not pull the antenna or power supply cable, detach them by holding the connectors.

Declaration of Conformity

UR32L is in conformity with the essential requirements and other relevant provisions of the CE, FCC, and RoHS.

For assistance, please contact

Milesight technical support:

Email: iot.support@milesight.com

Fax: 86-592-5023065

Address: Building C09, Software Park III,
Xiamen 361024, China

Revision History

Date	Doc Version	Description
Mar. 23, 2021	V 1.0	Initial version
Sept. 17, 2021	V 1.1	<ol style="list-style-type: none"> 1. Cellular and ping detection support IPv6 2. Add WAN connection type: DHCPv6 client, DS-Lite 3. Add DHCPv6 Server feature 4. Add IPv6 static routing feature 5. Add Expert Option box in IPsec settings 6. Support SMS inbox and outbox record clear
June 30, 2023	V 1.2	<ol style="list-style-type: none"> 1. Add high priority link revert feature; 2. Add MQTT and TR069 feature; 3. Support customized cellular MTU and IMS; 4. Support to import openVPN file configurations, add tls-crypt mode and authentication mode; 5. Support to configure L2TP hostname.
July 5, 2024	V 1.3	<ol style="list-style-type: none"> 1. Add WireGuard VPN feature; 2. Add cellular band selection and subnet mask customization; 3. Support to sync time with cellular operator; 4. Support to show Ethernet port connection status and configure PoE settings; 5. Update default secondary ICMP and DNS server address; 6. IPsec setting web GUI optimization.
April 11, 2025	V 1.4	<ol style="list-style-type: none"> 1. Add ZeroTier VPN; 2. Compatible with DeviceHub 2.0 and Milesight Development Platform; 3. Support 802.1x protocol to connect to Radius servers;

		<ol style="list-style-type: none">4. Add cellular custom DNS server option;5. Optimize the configuration modes of Email groups and phone groups;6. Support to configure username, test email address in SMTP client settings.
Sep.19, 2025	V 1.5	<ol style="list-style-type: none">1. Support cellular interface IP passthrough;2. Support multiple VPN;3. Support policy routing function;4. Switch setting web GUI optimization;5. Support to configure IP, reporting interval in DDNS settings;6. Support to configure service name, VLAN ID in PPPoE client settings;7. Support to configure IPv6 address in Switch setting;8. Support multiple local & remote subnets on IPsec servers and clients.
Dec. 30, 2025	V 1.6	<ol style="list-style-type: none">1. Add web password limitation and change prompt.2. Add partial backup.3. Add auto APN.4. Add Autp DST function in system time setting.5. Support automatic IP address acquisition via interface in DMVPN setting.6. Add multiple encryption and authentication algorithms for DMVPN.

Chapter 1 Product Introduction

1.1 Overview

UR32L is an industrial cellular router with embedded intelligent software features that are designed for multifarious M2M/IoT applications. Supporting global WCDMA and 4G LTE, UR32L provides drop-in connectivity for operators and makes a giant leap in maximizing uptime.

Adopting high-performance and low-power consumption industrial grade CPU and wireless module, the UR32L is capable of providing wire-speed network with low power consumption and ultra-small package to ensure the extremely safe and reliable connection to the wireless network.

UR32L is particularly ideal for smart grid, digital media installations, industrial automation, telemetry equipment, medical device, digital factory, finance, payment device, environment protection, water conservancy and so on.

For details of hardware and installation, please check UR32L Quick Start Guide.

1.2 Advantages

Benefits

- Built-in industrial strong NXP CPU, big memory
- Fast Ethernet for fast data transmission
- Multiple APN interfaces for simultaneous access to different network services
- Rugged enclosure, optimized for DIN rail or shelf mounting
- 3-year warranty included

Security & Reliability

- Automated failover/failback between Ethernet and Cellular
- Enable unit with security frameworks like
IPsec/OpenVPN/GRE/L2TP/PPTP/DMVPN/WireGuard/ZeroTier VPN
- Embed hardware watchdog, automatically recovering from various failure, and ensuring highest level of availability
- Establish a secured mechanism on centralized authentication and authorization of device access by supporting AAA (TACACS+, Radius, LDAP, local authentication) and multiple levels of user authority

Easy Maintenance

- Milesight DeviceHub/Development Platform provide easy setup, mass configuration, and centralized management of remote devices
- The user-friendly web interface design and more than one option of upgrade help administrator to manage the device as easy as pie

- Web GUI and CLI enable the admin to achieve simple management and quick configuration among a large quantity of devices
- Efficiently manage the remote routers on the existing platform through the industrial standard SNMP and TR069

Capabilities

- Link remote devices in an environment where communication technologies are constantly changing
- Industrial 32-bit ARM Cortex-A7 processor, high-performance operating up to 528MHz and 128 MB memory available to support more applications
- Support rich protocols like SNMP, TR069, MQTT, RIP, OSPF
- Support wide operating temperature ranging from -40°C to 70°C/-40°F to 158°F

Chapter 2 Access to Web GUI

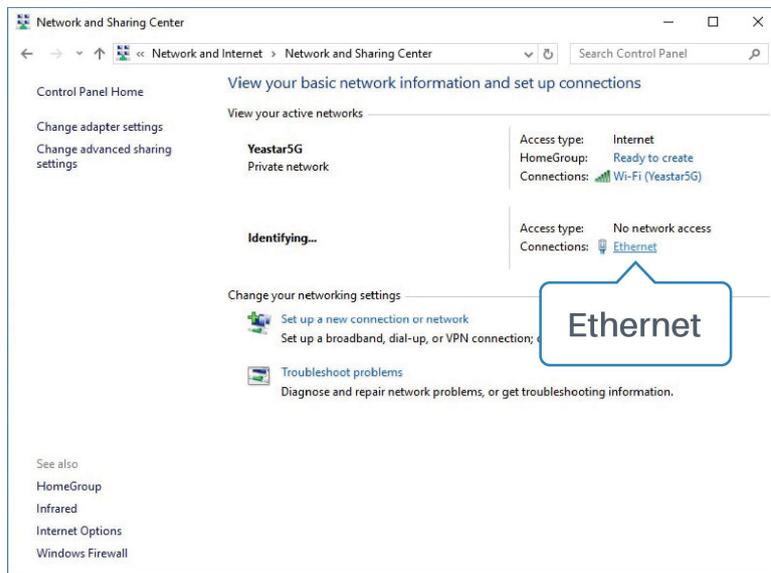

This chapter explains how to access to Web GUI of the UR32L router. Connect PC to LAN port of UR32L router directly. The following steps are based on Windows 10 operating system for your reference.

Username: **admin**

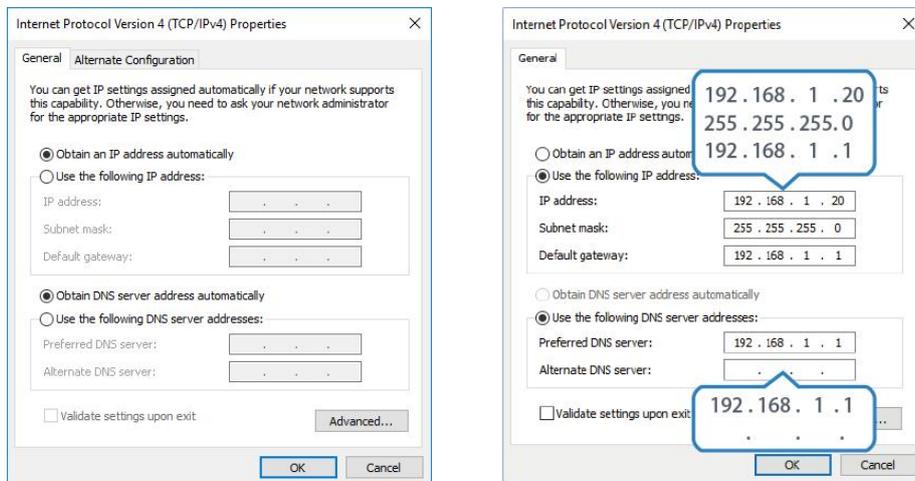

Password: **password**

IP Address: **192.168.1.1**

1. Go to “Control Panel” → “Network and Internet” → “Network and Sharing Center”, then click “Ethernet” (May have different names).

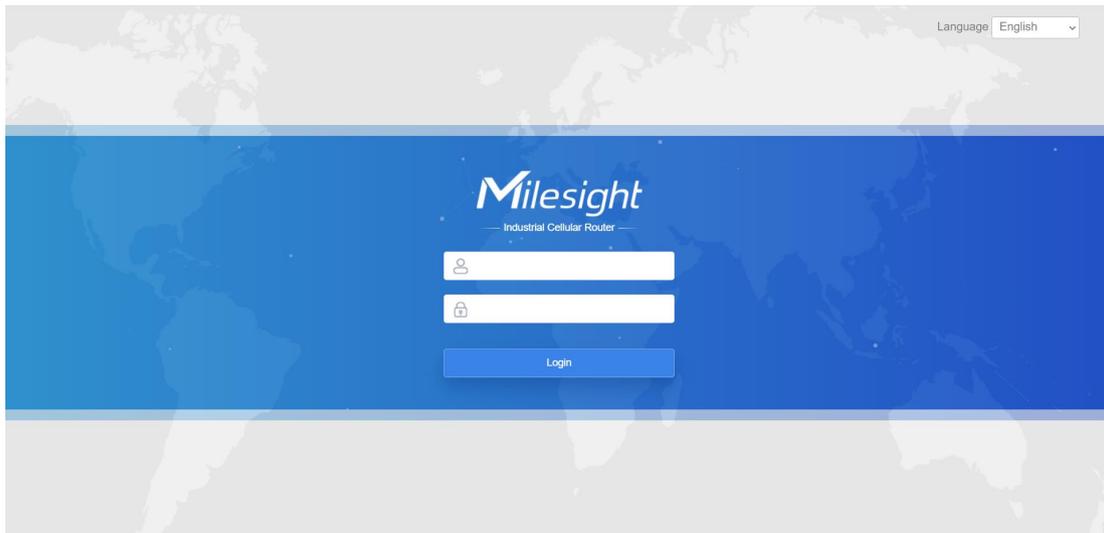

2. Go to “Properties” → “Internet Protocol Version 4(TCP/IPv4)”, select “Obtain an IP address automatically” or “Use the following IP address”, then assign a static IP manually within the same subnet of the device.

3. Open a Web browser on your PC (Chrome is recommended), type in the IP address <https://192.168.1.1>, and press Enter on your keyboard.

4. Enter the username, password, and click "Login".

- !** If you enter the username or password incorrectly more than 5 times, the login page will be locked for 10 minutes.

5. After logging the web GUI, it is necessary to change the web GUI password for the first time. The password must contain at least one letter and one number.

6. Use the new password to log in to the web GUI again. After logging the web GUI, you can view system information.

Chapter 3 Web Configuration

3.1 Status

3.1.1 Overview

You can view the system information of the router on this page.

System Information		System Status	
Model	UR32-LOGEU-P-W	Local Time	2025-09-08 08:25:53 Monday
Serial Number	6599F2762187	Uptime	03:50:12
Firmware Version	32.3.0.10-a3	CPU Load	47%
Hardware Version	V1.0	CPU Temperature	59°C
Cellular		RAM (Available/Capacity)	28MB/128MB(21.88%)
Status	Ready, FDD LTE,	Flash (Available/Capacity)	77MB/128MB(60.16%)

System Information	
Item	Description
Model	Show the model name of router.
Serial Number	Show the serial number of router.
Firmware Version	Show the currently firmware version of router.
Hardware Version	Show the currently hardware version of router.

Table 3-1-1-1 System Information

System Status	
Item	Description
Local Time	Show the currently local time of system.
Uptime	Show the information on how long the router has been running.
CPU Load	Show the current CPU utilization of the router.
CPU Temperature	Show current CPU temperature.
RAM (Available/Capacity)	Show the RAM capacity and the available RAM memory.
Flash (Available/Capacity)	Show the Flash capacity and the available Flash memory.

Table 3-1-1-2 System Status

Cellular	
Item	Description
Status	Show the real-time status of the currently SIM card
Current Cellular Link	Show the cellular network currently used for the data connection.
IPv4/IPv6	Show the IPv4/IPv6 address obtained from the mobile carrier. Note: UR3x-LOGEU only supports IPv4.
Connection Duration	Show the connection duration of the currently SIM card.

SIM Data Usage Monthly	Show the monthly data usage statistics of currently used SIM card.
------------------------	--

Table 3-1-1-3 Cellular Status

WAN	
Item	Description
Status	Show the currently status of WAN port.
IPv4/IPv6	The IPv4/IPv6 address configured WAN port.
MAC	The MAC address of the Ethernet port.
Connection Duration	Show the connection duration of the WAN port.

Table 3-1-1-4 WAN Status

LAN	
Item	Description
IP4/IPv6	Show the IP4/IPv6 address of the LAN port.
Connected Devices	Number of devices that connected to the router's LAN.

Table 3-1-1-5 LAN Status

3.1.2 Cellular

You can view the cellular network status of router on this page.

Overview	Cellular	Network	WLAN	VPN	Routing	Host List	GPS
Modem				SIM1-APN1			
Model	EC25				Status		Disconnected
Version	EC25EUXGAR08A08M1G_20.002.20.002				IPv4 Address		0.0.0.0/0
Signal Level	99asu (85dBm)				IPv4 Gateway		0.0.0.0
Register Status	Not registered				IPv4 DNS		0.0.0.0
IMEI	865847055727802				IPv6 Address		::
IMSI	-				IPv6 Gateway		::
ICCID	-				IPv6 DNS		::
ISP	-				Connection Duration		0 days, 00:00:00
Network Type	-						
Cellular Frequency Band	-				SIM1-APN2		
PLMN ID	-				Status		Disconnected
LAC	-				IPv4 Address		0.0.0.0/0
Cell ID	-				IPv4 Gateway		0.0.0.0
RSRP	-				IPv4 DNS		0.0.0.0
RSRQ	-				IPv6 Address		::
SINR	-				IPv6 Gateway		::
					IPv6 DNS		::
Data Usage Monthly				SIM1-APN3			
					Connection Duration		0 days, 00:00:00
RX	0.0 MIB						
TX	0.0 MIB				Status		Disconnected
ALL	0.0 MIB						

Figure 3-1-2-1

Modem Information	
Item	Description
Status	Show corresponding detection status of module and SIM card.
Version	Show the cellular module firmware version.

Signal Level	Show the cellular signal level.
Register Status	Show the registration status of SIM card.
IMEI	Show the IMEI of the module.
IMSI	Show IMSI of the SIM card.
ICCID	Show ICCID of the SIM card.
ISP	Show the network provider which the SIM card registers on.
Network Type	Show the connected network type, such as LTE, 3G, etc.
PLMN ID	Show the current PLMN ID, including MCC, MNC, LAC and Cell ID.
LAC	Show the location area code of the SIM card.
Cell ID	Show the Cell ID of the SIM card location.

Table 3-1-2-1 Modem Information

SIM-APN	
Item	Description
Status	Show the connection status of cellular network.
IPv4/IPv6 Address	Show the IPv4/IPv6 address and netmask of cellular network. Note: UR3x-L0GEU only supports IPv4.
IPv4/IPv6 Gateway	Show the IPv4/IPv6 gateway and netmask of cellular network. Note: UR3x-L0GEU only supports IPv4.
IPv4/IPv6 DNS	Show the IPv4/IPv6 DNS of cellular network. Note: UR3x-L0GEU only supports IPv4.
Connection Duration	Show information on how long the cellular network has been connected.

Table 3-1-2-2 Network Status

Data Usage Monthly	
Item	Description
RX	Show the monthly rx data usage statistics of SIM.
TX	Show the monthly tx data usage statistics of SIM.
ALL	Show the monthly all data usage statistics of SIM.

Table 3-1-2-3 Data Usage Information

3.1.3 Network

On this page you can check the WAN and LAN status of the router.

WAN-IPv4						
Port	Status	Type	IPv4	Gateway	DNS	Connection Duration
LAN1/WAN	up	Static	192.168.22.210/24	192.168.22.1	114.114.114.114	08h 32m 53s
WAN-IPv6						
Port	Status	Type	IPv6	Gateway	DNS	Connection Duration
LAN1/WAN	up	Static	fe80::26e1:24ff:fe11:2fea/64	-	-	08h 32m 53s

Figure 3-1-3-1

WAN Status	
Item	Description
Port	Show the name of WAN port.

Status	Show the status of WAN port. "up" refers to a status that WAN is enabled and Ethernet cable is connected. "down" means Ethernet cable is disconnected or WAN function is disabled.
Type	Show the dial-up connection type of WAN port.
IPv4/IPv6	Show the IPv4 address with netmask or IPv6 address with prefix-length of WAN port.
Gateway	Show the gateway of WAN port.
DNS	Show the DNS of WAN port.
Connection Duration	Show the information on how long the Ethernet cable has been connected on WAN port when WAN function is enabled. Once WAN function is disabled or Ethernet connection is disconnected, the duration will stop.

Table 3-1-3-1 WAN Status

Bridge				
Name	STP	IPv4	IPv6	Members
Bridge0	Disabled	192.168.219.1/24	7878::1/64	vlan 1,WLAN

Figure 3-1-3-2

Bridge	
Item	Description
Name	Show the name of the bridge interface.
STP	Show if STP is enabled.
IPv4/IPv6	Show the IPv4/IPv6 address and netmask of the bridge interface.
Netmask	Show the Netmask of the bridge interface.
Members	Show the members of the bridge interface.

Table 3-1-3-2 Bridge Status

3.1.4 VPN

You can check VPN status on this page, including PPTP, L2TP, IPsec, OpenVPN and DMVPN.

Clients			
Name	Status	Local IP	Remote IP
Server			
Name	Status		
OpenVPN Server	Disabled		
Ipsec Server	Disabled		
Connected List			
Server Type	Client IP	Duration	

Figure 3-1-4-1

VPN Status	
Item	Description
Clients	
Name	Show the name of the enabled VPN clients.
Status	Show the status of client. "Connected" refers to a status that client is connected to the server. "Disconnected" means client is disconnected to the server.
Local IP	Show the local IP address of the tunnel.
Remote IP	Show the real remote IP address of the tunnel.
Server	
Name	Show the name of the enabled VPN Server.
Status	Show the status of Server.
Connected List	
Server Type	Show the type of the server.
Client IP	Show the IP address of the client which connected to the server.
Duration	Show the information about how long the client has been connected to this server when the server is enabled. Once the server is disabled or connection is disconnected, the duration will stop counting.

Table 3-1-4-1 VPN Status

3.1.5 Routing

You can check routing status on this page, including the routing table and ARP cache.

Routing Table					
Destination	Netmask/Prefix Length	Gateway	Interface	Metric	
0.0.0.0	0.0.0.0	192.168.40.1	LAN1/WAN	1	
8.8.8.8	255.255.255.255	192.168.40.1	LAN1/WAN	1	
114.114.114.114	255.255.255.255	192.168.40.1	LAN1/WAN	1	
127.0.0.0	255.0.0.0	-	Loopback	-	
192.168.2.0	255.255.255.0	-	vlan2	-	
192.168.3.0	255.255.255.0	-	vlan3	-	
192.168.10.0	255.255.255.0	-	Bridge0	-	
192.168.40.0	255.255.255.0	-	LAN1/WAN	-	
:::1	128	-	Loopback	-	

ARP Cache			
IP	MAC	Interface	
192.168.10.101	00:00:00:00:00:00	Bridge0	
192.168.40.201	24:e1:24:16:64:2f	LAN1/WAN

192.168.40.35	58:11:22:92:f8:c4	LAN1/WAN	
8.8.8.8	00:00:00:00:00:00	LAN1/WAN	
192.168.40.41	50:eb:f6:9f:aa:60	LAN1/WAN	Manual Refresh

Figure 3-1-5-1

Item	Description
Routing Table	
Destination	Show the IP address of destination host or destination network.
Netmask/Prefix Length	Show the netmask or prefix length of destination host or destination network.
Gateway	Show the IP address of the gateway.
Interface	Show the outbound interface of the route.
Metric	Show the metric of the route.
ARP Cache	
IP	Show the IP address of ARP pool.
MAC	Show the IP address's corresponding MAC address.
Interface	Show the binding interface of ARP.

Table 3-1-5-1 Routing Information

3.1.6 Host List

You can view the host information on this page.

DHCP Leases		
IP	MAC/DUID	Lease Remaining Time
192.168.1.113	c8:5b:76:b2:56:1f	23h 07m 24s
2004::200	00:01:00:01:27:cc:cf:61:c8:5b:76:b2:56:1f	23h 09m 22s

MAC Binding	
IP	MAC/DUID

Figure 3-1-6-1

Host List	
Item	Description
DHCP Leases	
IP Address	Show IP address of DHCP client
MAC/DUID	Show MAC address of DHCPv4 client or DUID of DHCPv6 client.
Lease Time Remaining	Show the remaining lease time of DHCP client.
MAC Binding	
IP & MAC	Show the IP address and MAC address set in the Static IP list of DHCP service.

Table 3-1-6-1 Host List Description

3.2 Network

3.2.1 Interface

3.2.1.1 Link Failover

This section describes how to configure link failover strategies, their priority and the ping settings, each rule owns its own ping rules by default. Router will follow the priority to choose the next available interface to access the internet, make sure you have enable the full interface that you need to use here. If priority 1 can only use IPv4, UR32L will select a second link which IPv6 works as main IPv6 link and vice versa.

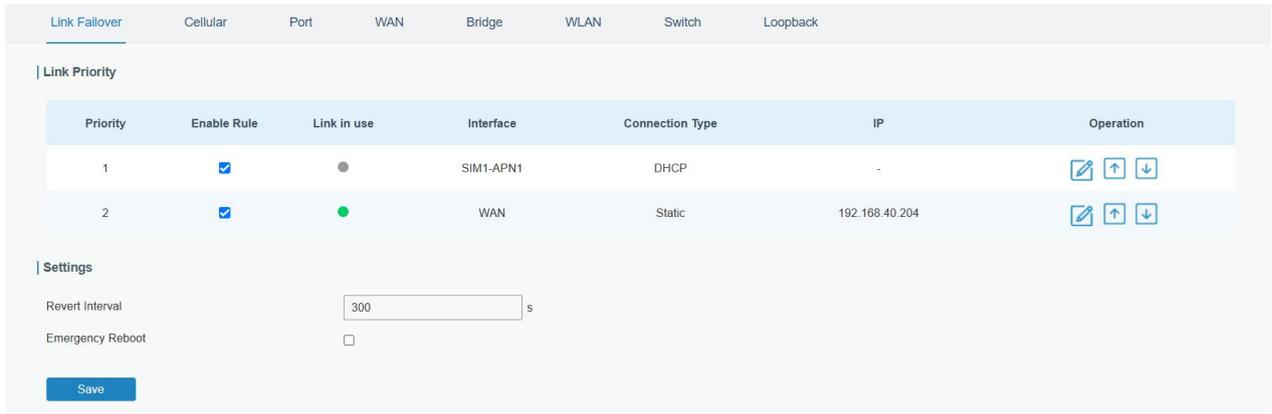

Figure 3-2-1-1

Link Failover	
Item	Description
Link Priority	
Priority	Display the priority of each interface, you can modify it by the operation's up and down button.
Enable Rule	If enabled, the router will put this interface into its switching rule. For the Cellular interface, if it's not enabled here, the interface will be disabled as well.
Link In Use	Mark whether this interface is in use with Green color
Interface	Display the name of the interface.
Connection type	Display how to obtain the IP address in this interface, like static IP or DHCP.
IP	Display the IP address of the interface.
Operation	You can change the priority of the rules and configure the ping detection rules here.
Settings	
Revert to High Priority Link	When the connection of high priority link returns back, reverting back to high priority link.
Revert Interval	Specify the number of seconds to waiting for switching to the link with higher priority, 0 means disable the function.
Emergency Reboot	Enable to reboot the device if no link is available.

Table 3-2-1-1 Link Failover Parameters

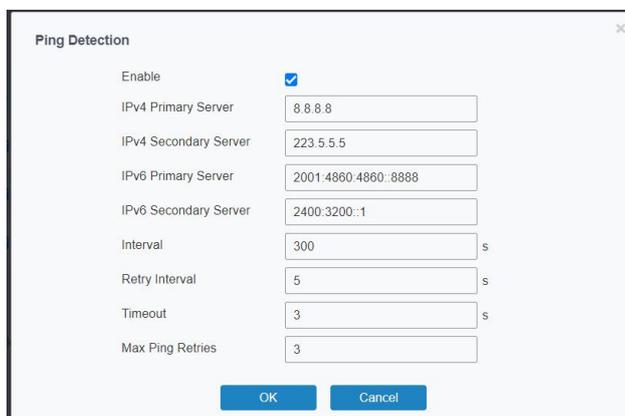

Figure 3-2-1-2

Ping Detection	
Item	Description
Enable	If enabled, the router will periodically detect the connection status of the link.
IPv4/IPv6 Primary Server	The router will send ICMP packet to the IPv4/IPv6 address or hostname to determine whether the Internet connection is still available or not.
IPv4/IPv6 Secondary Server	The router will try to ping the secondary server name if primary server is not available.
Interval	Time interval (in seconds) between two Pings.
Retry Interval	Set the ping retry interval. When ping failed, the router will ping again in every retry interval.
Timeout	The maximum amount of time the router will wait for a response to a ping request. If it does not receive a response for the amount of time defined in this field, the ping request will be considered to have failed.
Max Ping Retries	The retry times of the router sending ping request until determining that the connection has failed.

Table 3-2-1-2 Ping Detection Parameters

3.2.1.2 Cellular

This section explains how to set the related parameters for the cellular network. The UR32L features a single cellular interface, it is fixed to create 3 sub-cellular network interfaces, each supporting the configuration of one APN. The three sub-cellular network interfaces can be active at one time, enabling different network services to be accessed simultaneously through multiple APNs when the cellular network is registered.

Note:

- To use the multi-APN feature for the first time, a device reboot is required.
- After enabling multi-APN, different sub-interfaces on the same SIM card cannot add the same APN.

The screenshot displays the configuration interface for SIM1. At the top right, there is a 'SIM Setting' button. Below it is a table with columns: Interface Name, Status, Network Type, IP, APN, Enable Status, and Operation. The table contains three rows for SIM1-APN1, SIM1-APN2, and SIM1-APN3. SIM1-APN1 has a status of 'Connect Failed', while the others are '-'. Below the table is the 'Connection Setting' section, which includes a 'Connection Mode' dropdown set to 'Connect on Demand', 'Re-dial Interval(s)' set to 5, 'Max Idle Time(s)' set to 60, and checkboxes for 'Triggered by Call' and 'Triggered by SMS', both of which are unchecked. A 'Save & Apply' button is located at the bottom left of the settings area.

Interface Name	Status	Network Type	IP	APN	Enable Status	Operation

Figure 3-2-1-3

Cellular Setting	
Item	Description
Interface Name	Display cellular network interface names.
Status	Show the cellular network connection status.
Network Type	Select from "Auto", "4G Only", "3G Only", and "2G Only". Auto: connect to the network with the strongest signal automatically. 4G Only: connect to 4G network only. And so on.
IP	IP address corresponding to this cellular network interface.
APN	APN name corresponding to this cellular network interface.
Enable Status	Show the enable status of this interface.
Operation	You can edit the configuration items for this cellular network interface.
Connection Setting	
Item	Description
Connection Mode	Select "Always Online" and "Connect on Demand".
Re-dial Interval(s)	Set the interval to dial into ISP when it loses connection. The default value is 5s.
Max Idle Times	Set the maximum duration of the router when the current link is under idle status. Range: 10-3600
Triggered by Call	The router will automatically switch from offline mode to cellular network mode upon receiving a call from a specific phone number.
Call Group	Select a call group for the call trigger. Go to System > Phone&SMS > Phone to set up phone group.
Triggered by SMS	The router will switch from offline mode to cellular network mode automatically when it receives a specific SMS from the specific mobile phone.
SMS Group	Select an SMS group for the trigger. Go to System > Phone&SMS > SMS to set up an SMS group.
SMS Text	Fill in the SMS content for triggering.

Table 3-2-1-3 Cellular Parameters

The screenshot shows a 'SIM Setting' dialog box with the following fields and values:

- PIN Code: [Empty text box]
- Access Number: [Empty text box]
- Network Type: Auto (dropdown menu)
- Cellular Frequency Band: B1, B3, B7, B8, B20, B28A, B38, B40, B41 (text box)
- IMS Enable:
- SMS Center: [Empty text box]
- Roaming:
- IPv4 Subnet Mask: [Empty text box]
- Data Limit: 0 MB (text box)
- Billing Day: Day 1 of The Month (dropdown menu)

Buttons: OK, Cancel

Figure 3-2-1-4

SIM Setting	
Item	Description
PIN Code	Enter a 4-8 characters PIN code to unlock the SIM.
Access Number	Enter the dial-up center NO. For cellular dial-up connection provided by local ISP.
Network Type	Select from "Auto", "4G Only", "3G Only", and "2G Only". Auto: connect to the network with the strongest signal automatically. 4G Only: connect to 4G network only. And so on.
Cellular Frequency Band	Select the cellular bands used to register the cellular network. It can be used to optimize cellular speeds by selecting specific bands.
IMS Enable	Enable or disable IMS function.
SMS Center	Enter the local SMS center number for storing, forwarding, converting and delivering SMS message.
Roaming	Enable or disable roaming.
IPv4 Subnet Mask	Customize the cellular subnet mask. If blank, the device will use the subnet mask provided by the cellular base station.
Data Limit	When you reach the specified data usage limit, the data connection of the currently used SIM card will be disabled. 0 means disable the function.
Billing Day	Choose the billing day of the SIM card, then the router will reset the data used to 0.

Table 3-2-1-4 SIM Parameters

The screenshot shows a configuration window titled "SIM1-APN1". The fields are as follows:

- Interface Name: SIM1-APN1
- Protocol Type: IPv4
- APN: (empty text box)
- Username: (empty text box)
- Password: (empty text box with a show/hide icon)
- Authentication Type: None

3.2.1.3 Port

This section describes how to configure the Ethernet port parameters.

UR32L cellular router supports 2 Fast Ethernet ports.

Port Setting					
Port	Connection Status	Status	Property	Speed	Duplex
LAN1/WAN	Connected	up	wan	auto	auto
LAN2	Connected	up	lan	auto	auto

Figure 3-2-1-6

Port Setting	
Item	Description
Port	Users can define the Ethernet ports according to their needs.

Connection Status	Show the connection status of this Ethernet port.
Status	Set the status of the Ethernet port; select "up" to enable and "down" to disable.
Property	Show the Ethernet port's type, as a WAN port or a LAN port.
Speed	Set the Ethernet port's speed. The options are "auto", "100 Mbps", and "10 Mbps".
Duplex	Set the Ethernet port's mode. The options are "auto", "full", and "half".

Table 3-2-1-6 Port Parameters

Note:

- Only the PoE version (model name included "-P") supports the below settings.
- These settings only work when this router is powered by 48V.
- Only the devices with hardware version 4.0 and later support these features.
- Only when the port property of LAN1/WAN is set to LAN port, the PoE setting will work.

Port	PoE	Power Supply	Voltage (V)	Current (mA)	Power (W)	Describe	PING detection IP	Operation
LAN1	Enable	Power On	47	79	3.745		1.2.3.4	  
LAN2	Enable	Power On	47	120	5.688		1.2.3.4	  

Figure 3-2-1-7

Figure 3-2-1-8

Ping Detection reboot	
Item	Description
Enable	If enabled, the router will periodically detect the connection status of the port. If detection fails, the router will reboot this port.
Destination IP	The router will send an ICMP packet to the IPv4 address to determine whether the connection is still available or not.
Interval	Time interval (in seconds) between two Pings.
Ping Retry Interval	Set the ping retry interval. When ping fails, the router will ping again in every retry interval.
Overtime Period	The maximum amount of time the router will wait for a response to a ping request. If it does not receive a response for the amount of time defined in this field, the ping request will be considered to have failed.
Max Ping Retries	The retry times of the router sending ping request until determining that the connection has failed.
Reboot Interval	The power-off interval of this Ethernet port.
Max Reboot Times	The retry times of the router rebooting this port. 0 means no limits.

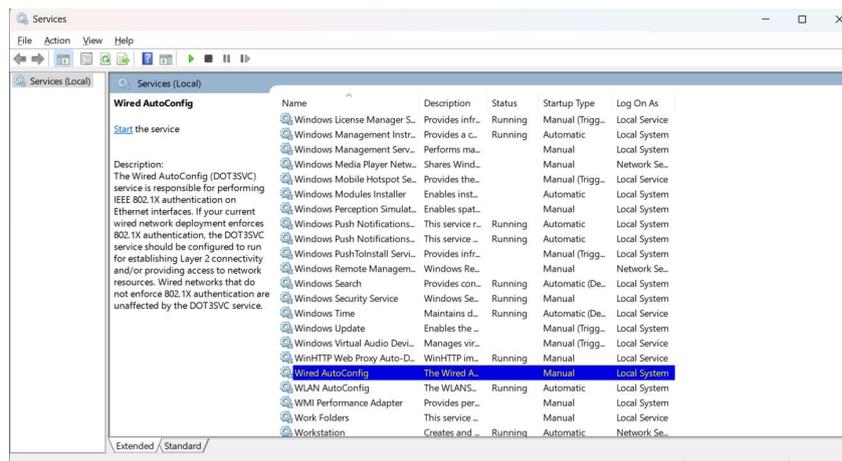

Figure 3-2-1-9

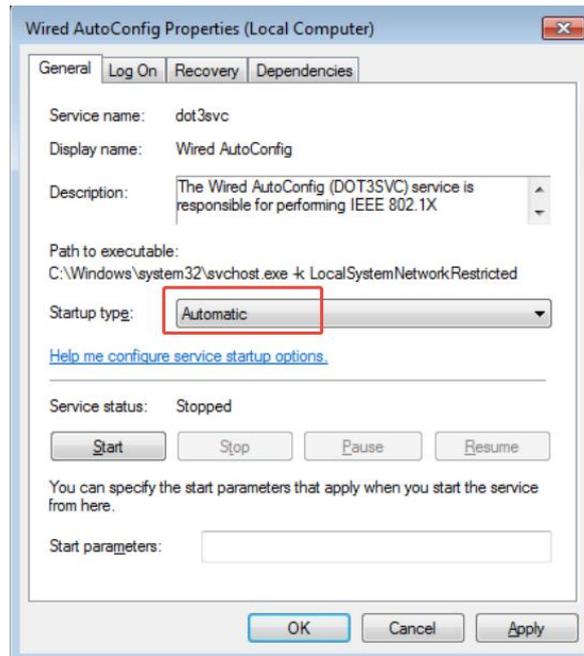

Radius Authentication	
Item	Description
Enable	Enable or disable Radius authentication for the wired portion of the LAN port.
Radius-Authentication-Server	Enter the IP address of the Radius authentication server.
Radius-Authentication-Port	Enter the port of the Radius authentication server. Default: 1812
Radius-Authentication-Secret	Enter the shared secret for the Radius authentication server.
NAS Identifier	Unique identifier, used to identify the access device, can help the RADIUS server distinguish authentication requests from different access devices.

Table 3-2-1-9

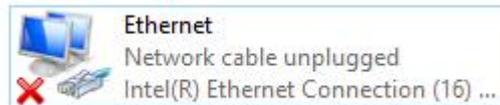

Note: Please refer to below steps to turn on the 802.1x authentication on a Windows computer:

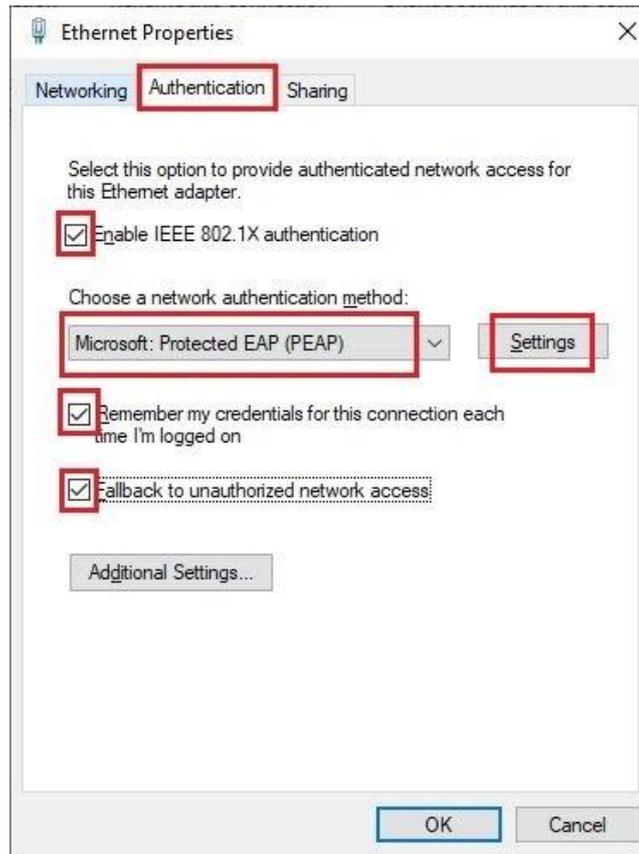

1. Enable the **Wired Autoconfig** and set it to start automatically.

2. Go to **Control Panel > Network and Internet > Network and Sharing Center** to select **Ethernet** connection to enable 802.1x authentication, and configure according to the authentication method provided by the authentication server.

3.2.1.4 WAN

The WAN port can be connected with an Ethernet cable to get Internet access.

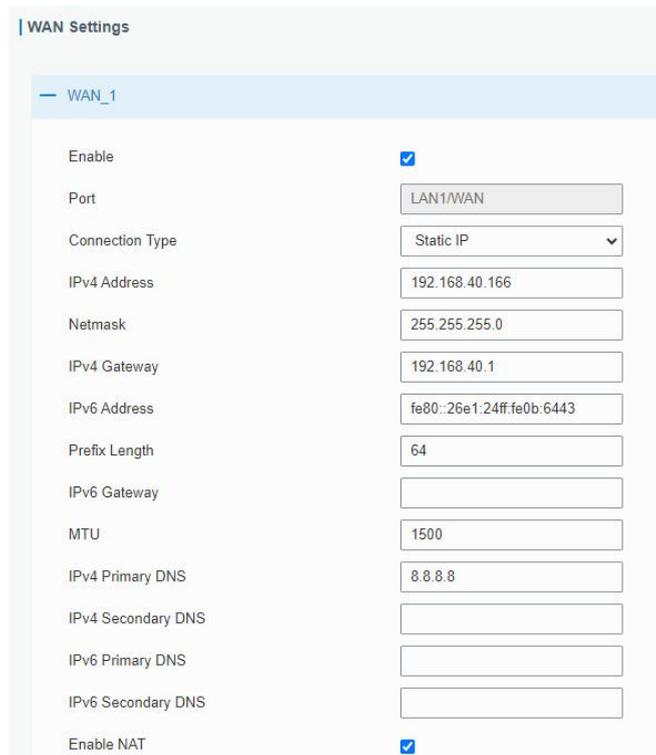

Figure 3-2-1-10

WAN Setting		
Item	Description	Default
Enable	Enable WAN function.	Enable
Port	The port that is currently set as WAN port.	WAN
Connection Type	<p>Select connection type as required.</p> <p>Static IP: assign a static IP address, netmask and gateway for Ethernet WAN interface.</p> <p>DHCP Client: configure Ethernet WAN interface as DHCP Client to obtain IP address automatically.</p> <p>PPPoE: configure Ethernet WAN interface as PPPoE Client.</p> <p>-DHCPv6 Client: configure Ethernet WAN interface as DHCP Client to obtain IPv6 address automatically.</p> <p>Dual-Stack Lite: use IPv4-in-IPv6 tunneling to send terminal device's IPv4 packet through a tunnel on the IPv6 access network to the ISP.</p>	Static IP
MTU	Set the maximum transmission unit.	1500
IPv4 Primary DNS	Set the primary IPv4 DNS server.	8.8.8.8
IPv4 Secondary DNS	Set the secondary IPv4 DNS server.	-- --
IPv6 Primary DNS	Set the primary IPv6 DNS server.	-- --
IPv6 Secondary DNS	Set the secondary IPv6 DNS server.	-- --
Enable NAT	Enable or disable NAT function. When enabled, a private IP can be translated to a public IP.	Enable

Table 3-2-1-10 WAN Parameters

1. Static IP Configuration

If the external network assigns a fixed IP for the WAN interface, select Static IP mode.

Enable	<input checked="" type="checkbox"/>
Port	LAN1/WAN
Connection Type	Static IP
IPv4 Address	192.168.45.194
Netmask	255.255.255.0
IPv4 Gateway	192.168.45.1
IPv6 Address	fe80::26e1:24ff:ef0:ef7f
Prefix Length	64
IPv6 Gateway	
MTU	1500
IPv4 Primary DNS	8.8.8.8
IPv4 Secondary DNS	223.5.5.5
IPv6 Primary DNS	
IPv6 Secondary DNS	
Enable NAT	<input checked="" type="checkbox"/>
Multiple IP Address	

IP Address	Netmask	Operation
		<input type="button" value="+"/>

Figure 3-2-1-11

Static IP		
Item	Description	Default
IPv4 Address	Set the IPv4 address of the WAN port.	192.168.0.1
Netmask	Set the Netmask for WAN port.	255.255.255.0
IPv4 Gateway	Set the gateway for WAN port's IPv4 address.	192.168.0.2
IPv6 Address	Set the IPv6 address which can access the Internet.	Generated from Mac address
Prefix-length	Set the IPv6 prefix length to identify how many bits of a Global Unicast IPv6 address are there in the network part. For example, in 2001:0DB8:0000:000b::/64, the number 64 is used to identify that the first 64 bits are in network part.	64
IPv6 Gateway	Set the gateway for WAN port's IPv6 address. E.g.2001:DB8:ACAD:4::2.	--
Multiple IP Address	Set the multiple IP addresses for WAN port.	Null

Table 3-2-1-11 Static Parameters

2. DHCP Client/DHCPv6 Client

If the external network has DHCP server enabled and has assigned IP addresses to the Ethernet WAN interface, select DHCP/DHCPv6 client mode to obtain IP address automatically.

Enable	<input checked="" type="checkbox"/>
Port	LAN1/WAN
Connection Type	DHCP Client
MTU	1500
Use Peer DNS	<input type="checkbox"/>
IPv4 Primary DNS	8.8.8.8
IPv4 Secondary DNS	223.5.5.5
Enable NAT	<input checked="" type="checkbox"/>

Figure 3-2-1-12

Enable	<input checked="" type="checkbox"/>
Port	LAN1/WAN
Connection Type	DHCPv6 Client
Request IPv6-address	None
Request IPv6-prefix of length	0-64
MTU	1500
IPv6 Primary DNS	
IPv6 Secondary DNS	
Enable NAT	<input checked="" type="checkbox"/>

Figure 3-2-1-13

DHCP Client	
Item	Description
Use Peer DNS	Obtain peer DNS automatically during PPP dialing. DNS is necessary when visiting domain name.
DHCPv6 Client	
Request IPv6-address	Choose the ways to obtain the IPv6 address from the DHCP Server. Select from try, force, none. Try: The DHCP Server will assign specific address in priority. Force: The DHCP Server assigns specific address only. None: The DHCP Server will randomly assign address. The specific address is relevant to the prefix length of IPv6 address you set.
Request prefix length of IPv6	Set the prefix length of IPv6 address which router is expected to obtain from DHCP Server.

Table 3-2-1-12 DHCP Client Parameters

3. PPPoE

PPPoE refers to a point to point protocol over Ethernet. User has to install a PPPoE client on the basis

of the original connection way. With PPPoE, remote access devices can get control of each user.

Enable	<input checked="" type="checkbox"/>
Port	WAN
Connection Type	PPPoE
Username	<input type="text"/>
Password	<input type="password"/>
Service Name	<input type="text"/>
VLAN ID	<input type="text"/>
Link Detection Interval(s)	60
Max Retries	0
MTU	1500
Use Peer DNS	<input type="checkbox"/>
IPv4 Primary DNS	223.5.5.5
IPv4 Secondary DNS	114.114.114.114
Enable NAT	<input checked="" type="checkbox"/>

Figure 3-2-1-14

PPPoE	
Item	Description
Username	Enter the username provided by your Internet Service Provider (ISP).
Password	Enter the password provided by your Internet Service Provider (ISP).
Service Name	Configure the service name that the client will request.
VLAN ID	Configure the VLAN ID to identify and isolate network traffic for different services.
Link Detection Interval (s)	Set the heartbeat interval for link detection. Range: 1-600.
Max Retries	Set the maximum retry times after it fails to dial up. Range: 0-9.
Use Peer DNS	Obtain peer DNS automatically during PPP dialing. DNS is necessary when visiting domain name.

Table 3-2-1-13 PPPoE Parameters

4. Dual-Stack Lite

Dual-Stack Lite (DS-Lite) uses IPv4-in-IPv6 tunneling to send a subscriber's IPv4 packet through a tunnel on the IPv6 access network to the ISP. The IPv6 packet is decapsulated to recover the subscriber's IPv4 packet and is then sent to the Internet after NAT address and port translation and

other LSN related processing. The response packets traverse through the same path to the subscriber.

Enable	<input checked="" type="checkbox"/>
Port	LAN1/WAN
Connection Type	Dual-Stack Lite
IPv6 Gateway	<input type="text"/>
DS-Lite AFTR Address	<input type="text"/>
Local IPv6 Address	<input type="text"/>
MTU	1500
IPv4 Primary DNS	8.8.8.8
IPv4 Secondary DNS	223.5.5.5
IPv6 Primary DNS	<input type="text"/>
IPv6 Secondary DNS	<input type="text"/>
Enable NAT	<input checked="" type="checkbox"/>

Figure 3-2-1-15

Dual-Stack Lite	
Item	Description
IPv6 Gateway	Set the gateway for WAN port's IPv6 address.
DS-Lite AFTR Address	Set the DS-Lite AFTR server address.
Local IPv6 Address	Set the WAN port IPv6 address which use the same subnet as IPv6 gateway.

Table 3-2-1-14 Dual-Stack Lite Parameters

Related Configuration Example

[Ethernet WAN Connection](#)

3.2.1.5 Bridge

Bridge setting is used for managing local area network devices which are connected to LAN ports of the UR32L, allowing each of them to access the Internet.

Figure 3-2-1-16

Bridge		
Item	Description	Default
Name	Show the name of bridge. "Bridge0" is set by default and cannot be changed.	Bridge0
STP	Enable/disable STP.	Disable
IP Address	Set the IP address for bridge.	192.168.1.1
Netmask	Set the Netmask for bridge.	255.255.255.0
IPv6 Address	Set the IPv6 address for bridge.	2004::1/64
MTU	Set the maximum transmission unit. Range: 68-1500.	1500
Multiple IP Address	Set the multiple IP addresses for bridge.	Null

Table 3-2-1-15 Bridge Settings

3.2.1.6 Switch

VLAN is a kind of new data exchange technology that realizes virtual work groups by logically dividing the LAN device into network segments.

Figure 3-2-1-17

Switch	
Item	Description
VLAN Settings	
VLAN ID	Set the label ID of the VLAN. Range: 1-4094.

LAN 1/2/3/4	Make the VLAN bind with the corresponding ports and select status from "Tagged", "Untagged" and "Close" for Ethernet frame on trunk link.
CPU	Control communication between VLAN and other networks.
Switch Settings	
Name	Set interface name of VLAN.
VLAN ID	Select VLAN ID of the interface.
IPv4 Address	Set IPv4 address of LAN port.
Netmask	Set Netmask of LAN port.
IPv6 Address	Set IPv6 address of LAN port.
Prefix Length	Set the IPv6 prefix length of VLAN.
MTU	Set the maximum transmission unit of LAN port. Range: 68-1500.

Table 3-2-1-16 VLAN Trunk Parameters

3.2.1.7 Loopback

Loopback interface is used for replacing router's ID as long as it is activated. When the interface is DOWN, the ID of the router has to be selected again which leads to long convergence time of OSPF. Therefore, Loopback interface is generally recommended as the ID of the router.

Loopback interface is a logic and virtual interface on router. Under default conditions, there's no loopback interface on router, but it can be created as required.

The screenshot displays the configuration page for a loopback interface. Under the 'Loopback Address' section, the IP Address is set to 127.0.0.1 and the Netmask is set to 255.0.0.0. The 'Multiple IP Addresses' section contains a table with columns for IP Address, Netmask, and Operation, and a plus sign button to add more addresses. A 'Save' button is located at the bottom left of the configuration area.

Figure 3-2-1-18

Loopback		
Item	Description	Default
IP Address	Unalterable	127.0.0.1
Netmask	Unalterable	255.0.0.0
Multiple IP Addresses	Apart from the IP above, user can configure other IP addresses.	Null

Table 3-2-1-17 Loopback Parameters

3.2.2 DHCP

DHCP adopts Client/Server communication mode. The Client sends configuration request to the Server which feeds back corresponding configuration information and distributes IP address to the

Client so as to achieve the dynamic configuration of IP address and other information.

3.2.2.1 DHCP Server/DHCPv6 Server

UR32L can be set as a DHCP server or DHCPv6 server to distribute IP address when a host logs on and ensures each host is supplied with different IP addresses. DHCP Server has simplified some previous network management tasks requiring manual operations to the largest extent. UR32L only supports stateful DHCPv6 when working as DHCPv6 server.

The screenshot shows the configuration page for a DHCP Server. The 'Enable' checkbox is checked. The 'Interface' is set to 'Bridge0'. The 'Start Address' is '192.168.1.113', 'End Address' is '192.168.1.126', and 'Netmask' is '255.255.255.0'. The 'Lease Time (Min)' is '1440'. The 'Primary DNS Server' is '8.8.8.8' and the 'Secondary DNS Server' is '114.114.114.114'. The 'Windows Name Server' field is empty. Below the form is a table for 'Static IP' with columns for 'MAC Address', 'IP Address', and 'Operation'. A '+' button is visible in the bottom right corner of the table area.

Figure 3-2-2-1

The screenshot shows the configuration page for a DHCPv6 Server. The 'Enable' checkbox is checked. The 'Interface' is set to 'Bridge0'. The 'Start Address' is '2004:0:0:0:0:0:100', 'End Address' is '2004:0:0:0:0:0:200', and 'Prefix Length' is '64'. The 'Lease Time (Min)' is '1440'. The 'Primary DNS Server' is '2001:00B0:3000:3001::1' and the 'Secondary DNS Server' is '2001:4860:4860:8888'. Below the form is a table for 'Static IP' with columns for 'DUID', 'IPv6 Address', and 'Operation'. A '+' button is visible in the bottom right corner of the table area.

Figure 3-2-2-2

DHCP/DHCPv6 Server		
Item	Description	Default
Enable	Enable or disable DHCP server.	Enable
Interface	Select interface.	Bridge0

Start Address	Define the beginning of the pool of IP addresses which will be leased to DHCP clients.	192.168.1.0 0
End Address	Define the end of the pool of IP addresses which will be leased to DHCP clients.	192.168.1.9 9
Netmask	Define the subnet mask of IPv4 address obtained by DHCP clients from DHCP server.	255.255.255 .0
Prefix Length	Set the IPv6 prefix length of IPv6 address obtained by DHCP clients from DHCP server.	64
Lease Time (Min)	Set the lease time on which the client can use the IP address obtained from DHCP server. Range: 1-10080.	1440
Primary DNS Server	Set the primary DNS server.	192.168.1.1
Secondary DNS Server	Set the secondary DNS server.	Null
Windows Name Server	Define the Windows Internet Naming Service obtained by DHCP clients from DHCP sever. Generally you can leave it blank.	Null
Static IP		
MAC Address	Set a static and specific MAC address for the DHCP client (it should be different from other MACs so as to avoid conflict).	Null
DUID	Set a static and specific DUID for the DHCPv6 client (it should be different from other DUID so as to avoid conflict).	Null
IP Address	Set a static and specific IP address for the DHCP client (it should be outside of the DHCP range).	Null

Table 3-2-2-1 DHCP Server Parameters

3.2.2.2 DHCP Relay

UR32L can be set as DHCP Relay to provide a relay tunnel to solve the problem that DHCP Client and DHCP Server are not in the same subnet.

Figure 3-2-2-3

DHCP Relay	
Item	Description
Enable	Enable or disable DHCP relay.

DHCP Server	Set DHCP server, up to 10 servers can be configured; separate them by blank space or ",".
-------------	---

3.2.3 Firewall

This section describes how to set the firewall parameters, including security, ACL, DMZ, Port Mapping, MAC Binding and SPI.

The firewall implements corresponding control of data flow at entry direction (from Internet to local area network) and exit direction (from local area network to Internet) according to the content features of packets, such as protocol style, source/destination IP address, etc. It ensures that the router operate in a safe environment and host in local area network.

3.2.3.1 Security

Website Blocking		
URL Blocking	Enter the HTTP address which you want to block.	
Keyword Blocking	You can block specific website by entering keyword. The maximum number of character allowed is 64.	

Table 3-2-3-1 Security Parameters

3.2.3.2 ACL

Access control list, also called ACL, implements permission or prohibition of access for specified network traffic (such as the source IP address) by configuring a series of matching rules so as to filter the network interface traffic. When router receives packet, the field will be analyzed according to the ACL rule applied to the current interface. After the special packet is identified, the permission or prohibition of corresponding packet will be implemented according to preset strategy.

The data package matching rules defined by ACL can also be used by other functions requiring flow distinction.

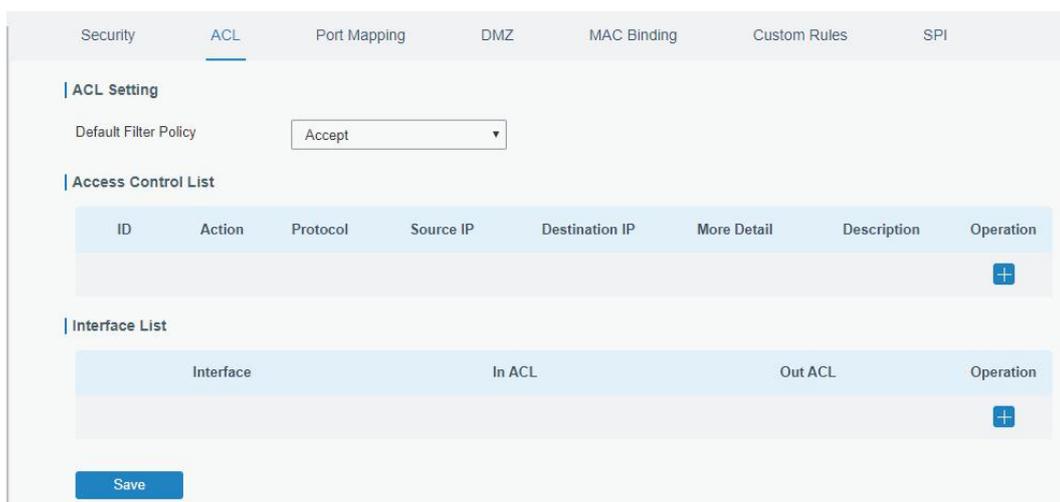

Figure 3-2-3-2

Type	extended
ID

Destination Port	Set destination port number. Range: 1-65535.
Start Destination Port	Set start destination port number. Range: 1-65535.

End Destination Port	Set end destination port number. Range: 1-65535.
More Details	Show information of the port.
Interface List	
Interface	Select network interface for access control.
In ACL	Select a rule for incoming traffic from ACL ID.
Out ACL	Select a rule for outgoing traffic from ACL ID.

Table 3-2-3-2 ACL Parameters

3.2.3.3 Port Mapping (DNAT)

When external services are needed internally (for example, when a website is published externally), the external address initiates an active connection. And, the router or the gateway on the firewall receives the connection. Then it will convert the connection into an internal connection. This conversion is called DNAT, which is mainly used for external and internal services.

Source IP	Source Port	Destination IP	Destination Port	Protocol	Description	Operation
0.0.0.0/0				TCP		X
						+

Figure 3-2-3-3

Port Mapping	
Item	Description
Source IP	Specify the host or network which can access local IP address. 0.0.0.0/0 means all.
Source Port	Enter the TCP or UDP port from which incoming packets are forwarded. Range: 1-65535.
Destination IP	Enter the IP address that packets are forwarded to after being received on the incoming interface.
Destination Port	Enter the TCP or UDP port that packets are forwarded to after being received on the incoming port(s). Range: 1-65535.
Protocol	Select from "TCP" and "UDP" as your application required.
Description	The description of this rule.

Table 3-2-3-3 Port Mapping Parameters

Related Configuration Example

[NAT Application Example](#)

3.2.3.4 DMZ

DMZ is a host within the internal network that has all ports exposed, except those forwarded ports in port mapping.

The screenshot shows a configuration page for DMZ. At the top, there is a header 'DMZ'. Below it, there is an 'Enable' checkbox which is currently unchecked. Underneath, there are two input fields: 'DMZ Host' and 'Source Address'. At the bottom of the form is a blue 'Save' button.

Figure 3-2-3-4

DMZ	
Item	Description
Enable	Enable or disable DMZ.
DMZ Host	Enter the IP address of the DMZ host on the internal network.
Source Address	Set the source IP address which can access to DMZ host. "0.0.0.0/0" means any address.

Table 3-2-3-4 DMZ Parameters

3.2.3.5 MAC Binding

MAC Binding is used for specifying hosts by matching MAC addresses and IP addresses that are in the list of allowed outer network access.

The screenshot shows a 'MAC Binding List' configuration page. It features a table with four columns: 'MAC', 'IP', 'Description', and 'Operation'. The 'Operation' column contains a blue plus sign icon. Below the table is a blue 'Save' button.

Figure 3-2-3-5

MAC Binding List	
Item	Description
MAC Address	Set the binding MAC address.
IP Address	Set the binding IP address.
Description	Fill in a description for convenience of recording the meaning of the binding rule for each piece of MAC-IP.

Table 3-2-3-5 MAC Binding Parameters

3.2.3.6 Custom Rules

In this page, you can configure your own custom firewall iptables rules.

The screenshot shows a 'Custom Rules' configuration page. It features a table with three columns: 'Rule', 'Description', and 'Operation'. The 'Rule' column contains the text 'Eg. -t filter -I INPUT -s 192.168.3.240 -j DROP'. The 'Operation' column contains a blue plus sign icon. Below the table is a blue 'Save' button.

Figure 3-2-3-6

Custom Rules	
Item	Description
Rule	Specify an iptables rule like the example shows. Tips: You must reboot the device to take effect after modifying or deleting the iptables rules.
Description	Enter the description of the rule.

Table 3-2-3-6 Custom Rules Parameters

3.2.3.7 SPI

The screenshot shows the 'SPI Firewall' configuration page. It contains a list of ten settings, each with a checkbox. The 'Filter Multicast', 'Block Wan SNMP access', 'Filter WAN NAT Redirection', and 'Block Anonymous Wan Request' settings are checked. A blue 'Save' button is located at the bottom of the configuration area.

Figure 3-2-3-7

SPI Firewall	
Item	Description
Enable	Enable/disable SPI firewall.
Filter Proxy	Blocks HTTP requests containing the "Host": string.
Filter Cookies	Identifies HTTP requests that contain "Cookie": String and mangle the cookie. Attempts to stop cookies from being used.
Filter ActiveX	Blocks HTTP requests of the URL that ends in ".ocx" or ".cab".
Filter Java Applets	Blocks HTTP requests of the URL that ends in ".js" or ".class".
Filter Multicast	Prevent multicast packets from reaching the LAN.
Filter IDENT(port 113)	Prevent WAN access to Port 113.
Block WAN SNMP access	Block SNMP requests from the WAN.
Filter WAN NAT Redirection	Prevent hosts on LAN from using WAN address of router to connect servers on the LAN (which have been configured using port redirection).
Block Anonymous WAN Requests	Stop the router from responding to "pings" from the WAN.

Table 3-2-3-7 SPI Parameters

3.2.4 QoS

Quality of service (QoS) refers to traffic prioritization and resource reservation control mechanisms rather than the achieved service quality. QoS is engineered to provide different priority for different applications, users, data flows, or to guarantee a certain level of performance to a data flow.

The screenshot displays the QoS configuration interface, divided into two tabs: QoS(Download) and QoS(Upload). The QoS(Download) tab is active. Under the 'Download Bandwidth' section, there is an 'Enable' checkbox (unchecked), a 'Default Category' dropdown menu, a 'Download Bandwidth' input field with the value '0' and a unit of 'kbits/s', and a 'Capacity' label. Below this is the 'Service Category' section, which contains a table with columns: Name, Percent(%), Max BW(kbps), Min BW(kbps), and Operation. A plus sign (+) is visible in the Operation column. Underneath is the 'Service Category Rules' section, which contains a table with columns: Name, Source IP, Source Port, Destination IP, Destination Port, Protocol, Service Category, and Operation. A plus sign (+) is visible in the Operation column. At the bottom of the interface is a 'Save' button.

Figure 3-2-4-1

QoS	
Item	Description
Download/Upload	
Enable	Enable or disable QoS.
Default Category	Select the default category from Service Category list.
Download/Upload Bandwidth Capacity	The download/upload bandwidth capacity of the network that the router is connected with, in kbps. Range: 1-8000000.
Service Category	
Name	You can use characters such digits, letters and "-".
Percent (%)	Set percent for the service category. Range: 0-100.
Max BW(kbps)	The maximum bandwidth that this category is allowed to consume, in kbps. The value should be less than the "Download/Upload Bandwidth Capacity" when the traffic is blocked.
Min BW(kbps)	The minimum bandwidth that can be guaranteed for the category, in kbps. The value should be less than the "MAX BW" value.
Service Category Rules	
Item	Description
Name	Give the rule a descriptive name.
Source IP	Source address of flow control (leaving it blank means any).
Source Port	Source port of flow control. Range: 0-65535 (leaving it blank means

	any).
Destination IP	Destination address of flow control (leaving it blank means any).
Destination Port	Destination port of flow control. Range: 0-65535 (leaving it blank means any).
Protocol	Select protocol from "ANY", "TCP", "UDP", "ICMP", and "GRE".
Service Category	Set service category for the rule.

[QoS Application Example](#)

3.2.5 VPN

Virtual Private Networks, also called VPNs, are used to securely connect two private networks together so that devices can connect from one network to the other network via secure channels.

The UR32L supports DMVPN, IPsec, GRE, L2TP, PPTP, OpenVPN, as well as GRE over IPsec and L2TP over IPsec.

3.2.5.1 DMVPN

A dynamic multi-point virtual private network (DMVPN), combining mGRE and IPsec, is a secure network that exchanges data between sites without passing traffic through an organization's headquarter VPN server or router.

Local IP address	DMVPN local tunnel IP address.
Interface	Select the interface IP address to be used.
GRE Hub IP Address	GRE Hub tunnel IP address.
GRE Local IP Address	GRE local tunnel IP address.
GRE Netmask	GRE local tunnel netmask.
GRE Key	GRE tunnel key.
Negotiation Mode	Select from "Main" and "Aggressive".
Authentication Algorithm	Select from "DES", "3DES", "AES128", "AES192" and "AES256".

Encryption Algorithm	Select from "MD5", "SHA1" and "SHA2-256".
DH Group	Select from "MODP768_1", "MODP1024_2", "MODP1536_5", "MODP2048-14" and "MODP3072-15".
Key	Enter the preshared key.
Local ID Type	Select from "Default", "ID", "FQDN", and "User FQDN"
IKE Life Time (s)	Set the lifetime in IKE negotiation. Range: 60-86400.
SA Algorithm	Select from "DES_MD5", "DES_SHA1", "AES128-SHA256", "3DES_MD5", "3DES_SHA1", "AES128_MD5", "AES128_SHA1", "AES192_MD5", "AES192_SHA1", "AES192-SHA256", "AES256_MD5", "AES256-SHA256" and "AES256_SHA1".
PFS Group	Select from "NULL", "MODP768_1", "MODP1024_2" and "MODP1536-5".
Life Time (s)	Set the lifetime of IPsec SA. Range: 60-86400.
DPD Interval Time (s)	Set DPD interval time
DPD Timeout (s)	Set DPD timeout.
Cisco Secret	Cisco Nhrp key.
NHRP Holdtime (s)	The holdtime of NHRP protocol.

Table 3-2-5-1 DMVPN Parameters

3.2.5.2 IPsec Server

IPsec is especially useful for implementing virtual private networks and for remote user access through dial-up connection to private networks. A big advantage of IPsec is that security arrangements can be handled without requiring changes to individual user computers.

IPsec provides three choices of security service: Authentication Header (AH), Encapsulating Security Payload (ESP), and Internet Key Exchange (IKE). AH essentially allows authentication of the senders' data. ESP supports both authentication of the sender and data encryption. IKE is used for cipher code exchange. All of them can protect one and more data flows between hosts, between host and gateway, and between gateways.

Figure 3-2-5-2

IPsec Server	
Item	Description
Enable	Enable or disable IPsec server mode.

IPsec Mode	Select Tunnel or Transport.
IPsec Protocol	Select from ESP or AH.
Local Subnet	Enter the local LAN subnet IP address on the IPsec tunnel. Note: Only when IKE version = IKEv2, is it supported to add multiple local subnets for connection.
Local ID Type	Select the identifier type, and send it to remote peer. Default: None ID: use local subnet IP address as ID FQDN: fully qualified domain name, example: test.user.com User FQDN: fully qualified username string with email address format, example: test@user.com
Remote Subnet	Set the remote LAN subnet on the IPsec tunnel. Note: Only when IKE version = IKEv2, is it supported to add multiple remote subnets for connection.
Remote ID type	Select the identifier type that is the same as remote peer local ID. Default: None ID: use remote subnet IP address as ID FQDN: fully qualified domain name, example: test.user.com User FQDN: fully qualified username string with email address format, example: test@user.com

Table 3-2-5-5 IPsec Parameters

3.2.5.4 GRE

Generic Routing Encapsulation (GRE) is a protocol that encapsulates packets in order to route other protocols over IP networks. It's a tunneling technology that provides a channel through which encapsulated data message could be transmitted and encapsulation and decapsulation could be realized at both ends.

In the following circumstances the GRE tunnel transmission can be applied:

- GRE tunnel could transmit multicast data packets as if it were a true network interface. Single use of IPSec cannot achieve the encryption of multicast.
- A certain protocol adopted cannot be routed.
- A network of different IP addresses shall be required to connect other two similar networks.

The screenshot shows a configuration interface for GRE settings. It features a main title 'GRE Settings' and three expandable sections: 'GRE_1', 'GRE_2', and 'GRE_3'. The 'GRE_1' section is currently expanded, revealing the following configuration options:

- Enable:** A checkbox that is currently unchecked.
- Remote IP Address:** An empty text input field.
- Local IP Address:** An empty text input field.
- Local Virtual IP Address:** An empty text input field.
- Netmask:** A text input field containing the value '255.255.255.0'.
- Peer Virtual IP Address:** An empty text input field.
- Global Traffic Forwarding:** A checkbox that is currently unchecked.
- Remote Subnet:** An empty text input field.
- Remote Netmask:** An empty text input field.
- MTU:** A text input field containing the value '1500'.
- Key:** An empty text input field.
- Enable NAT:** A checkbox that is currently checked.

The 'GRE_2' and 'GRE_3' sections are collapsed, each indicated by a plus sign (+) on the left.

Figure 3-2-5-7

GRE	
Item	Description
Enable	Check to enable GRE function.

3.2.5.6 PPTP

Point-to-Point Tunneling Protocol (PPTP) is a protocol that allows corporations to extend their own corporate network through private "tunnels" over the public Internet. Effectively, a corporation uses a wide-area network as a single large local area network.

The screenshot displays the 'PPTP Settings' interface. At the top, there is a header 'PPTP Settings' and a sub-header 'PPTP_1'. Below this, several configuration options are listed with corresponding input fields or checkboxes:

- Enable:** A checkbox that is currently unchecked.
- Remote IP Address:** A text input field.
- Username:** A text input field.
- Password:** A text input field.
- Authentication:** A dropdown menu currently set to 'Auto'.
- Global Traffic Forwarding:** A checkbox that is currently unchecked.
- Remote Subnet:** A text input field.
- Remote Subnet Mask:** A text input field.
- Advanced Settings:** A button with a right-pointing arrow.

Below the PPTP_1 section, there are two expandable sections for 'PPTP_2' and 'PPTP_3', each with a plus sign icon. At the bottom of the settings area, there is a blue 'Save' button.

Figure 3-2-5-10

PPTP	
Item	Description
Enable	Enable PPTP client. A maximum of 3 tunnels is allowed.
Remote IP Address	Enter the public IP address or domain name of PPTP server.
Username	Enter the username that PPTP server provides.
Password	Enter the password that PPTP server provides.
Authentication	Select from "Auto", "PAP", "CHAP", "MS-CHAPv1", and "MS-CHAPv2".
Global Traffic Forwarding	All of the data traffic will be sent out via PPTP tunnel once enable this function.
Remote Subnet	Set the peer subnet of PPTP.
Remote Subnet Mask	Set the netmask of peer PPTP server.

3.2.5.7 OpenVPN Client

OpenVPN is an open source virtual private network (VPN) product that offers a simplified security

framework, modular network design, and cross-platform portability. The default OpenVPN version of UR32L is 2.4.9.

UR32L supports running at most 3 OpenVPN clients at the same time. You can import the ovpn file directly or configure the parameters on this page to set clients.

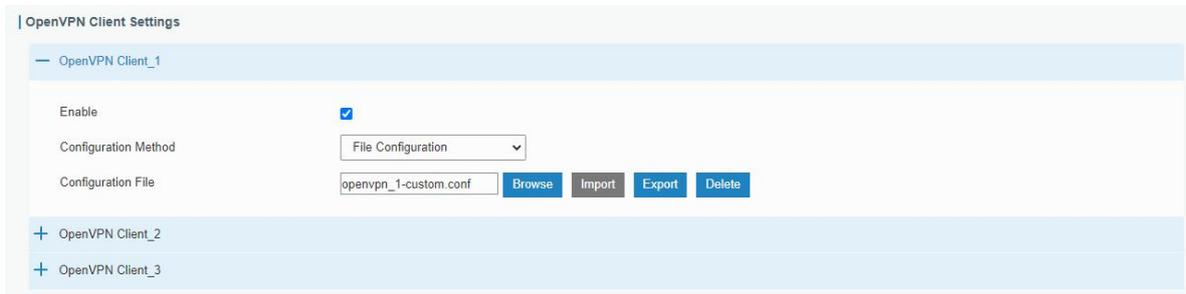

Figure 3-2-5-12

OpenVPN Client - File Configuration

Browse	Click to browse the client configuration ovpn format file including the settings and certificate contents. Please refer to the client configuration file according to sample: client.conf
Edit	Click to edit the imported file.
Export	Export the server configuration file.
Delete	Click to delete the configuration file.

Table 3-2-5-11 OpenVPN Client Parameters

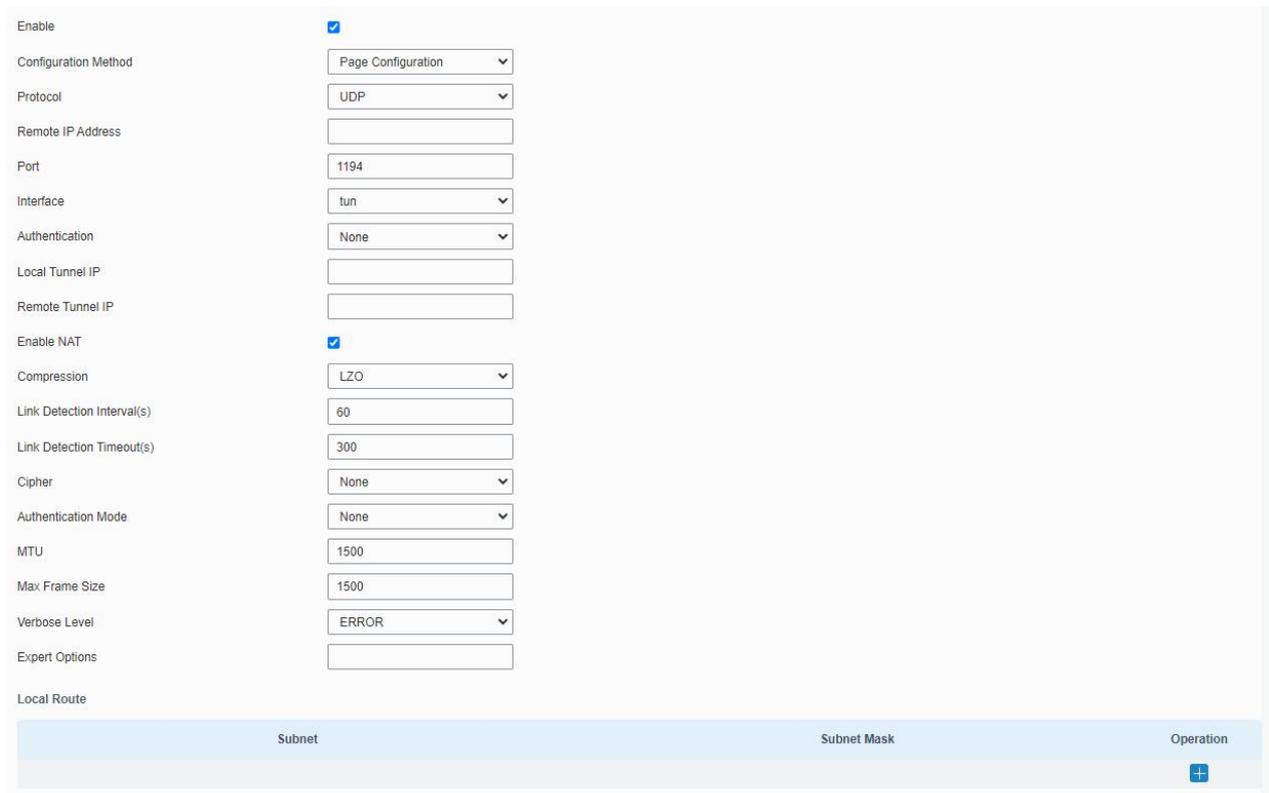

Figure 3-2-5-13

OpenVPN Client - Page Configuration	
Item	Description
Protocol	Select a transport protocol used by connecting UDP and TCP.
Remote IP Address	Enter remote OpenVPN server's IP address or domain name.
Port	Enter the TCP/UCP service number of remote OpenVPN server. Range: 1-65535.
Interface	Select virtual VPN network interface type from TUN and TAP. TUN devices encapsulate IPv4 or IPv6 (OSI Layer 3) while TAP devices encapsulate Ethernet 802.3 (OSI Layer 2).
Authentication Type	Select authentication type used to secure data sessions. Pre-shared: use the same secret key as server to complete the authentication. After selecting, go to Network > VPN > Certifications page to import a static.key to PSK field. Username/Password: use username/password which is preset in server side to complete the authentication. X.509 cert: use X.509 type certificate to complete the authentication. After selecting, go to Network > VPN > Certifications page to import CA certificate, client certificate and client private key to corresponding fields. X.509 cert + user: use both username/password and X.509 cert authentication type.
Local Virtual IP	Set local tunnel address when authentication type is None or Pre-shared .
Remote Virtual IP	Set remote tunnel address when authentication type is None or Pre-shared .
Global Traffic Forwarding	All the data traffic will be sent out via OpenVPN tunnel when this function is enabled.
Enable TLS Authentication	Select from None, TLS Auth and TLS Crypt. When selecting TLS Auth or TLS Crypt, go to Network > VPN > Certifications page to import a ta.key.
Compression	Select to enable or disable LZO to compress data.
Link Detection Interval (s)	Set link detection interval time to ensure tunnel connection. If this is set on both server and client, the value pushed from server will override the client local values. Range: 10-1800 s.
Link Detection Timeout (s)	OpenVPN will be reestablished after timeout. If this is set on both server and client, the value pushed from server will override the client local values. Range: 60-3600 s.
Cipher	Select from NONE, BF-CBC, DES-CBC, DES-EDE3-CBC, AES-128-CBC, AES-192-CBC and AES-256-CBC.
Authentication Mode	Select from NONE, MD5, SHA1, SHA256, and SHA512.
MTU	Enter the maximum transmission unit. Range: 128-1500.
Max Frame Size	Set the maximum frame size. Range: 128-1500.
Verbose Level	Select from ERROR, WARING, NOTICE and DEBUG.
Expert Options	User can enter some initialization strings in this field and separate the strings with semicolon. Example: ncp-ciphers AES-128-GCM; key direction 1

Local Route

Subnet	Set the local route's IP address.
Subnet Mask	Set the local route's netmask.

Figure 3-2-5-21

WireGuard	
Item	Description
Enable	Enable WireGuard interface. A maximum of 3 WireGaurd interfaces is allowed.
Interface	Show the WireGuard interface name.
Customized Private Key	Enable or disable to customize the private key of this WireGuard interface. If disabled, the client will use the private key generated by this router.
Public Key	Show the public key generated by the private key.
IP Address	Set the local virtual IP address and netmask. Example: 10.8.0.2/24
Listening Port	Set the port to send or receive WireGuard packets. The port numbers of different WireGuard interfaces should be different.
DNS	Set the DNS server address of this WireGuard interface. If left blank, the router will use DNS server address of common network interfaces (WAN, cellular, etc.).
MTU	Set the maximum transmission unit of this WireGuard interface. If left blank, the router will use MTU of common network interfaces (WAN, cellular, etc.).
Peer Table	Click "+" to add WireGuard peers of this WireGuard interface. One WireGuard interface can add 20 peers at most.

Table 3-2-5-15 WireGuard Parameters

Figure 3-2-5-22

WireGuard-Peer	
Item	Description
Peer	Set a WireGuard peer name. This name should be unique in this WireGuard client.
Public Key	Set the public key of WireGuard peer server/client.
Allowed IP	Set the real IP address and netmask of WireGuard peer's LAN network. Example: 192.168.1.0/24 One WireGuard peer supports to add 8 allowed IP addresses.
Route Allowed IP	Enable or disable to add static routings of allowed IP addresses.
Preshared Key	Set the presahred key and both this interface and peer interface should set the same key value.
Endpoint Address	Set IP address or domain name of WireGuard peer server/client.
Endpoint Port	Set the destination port of WireGuard peer server/client.
Keepalive Interval	After the connection is established, this WireGuard interface will send heartbeat packet regularly to keep alive. 0 means disabled.

3.2.5.11 ZeroTier

ZeroTier is a way to connect devices over your own private network anywhere in the world. You do this by creating a network and then joining two or more devices to that network.

Figure 3-2-5-23

ZeroTier	
Item	Description
ZeroTier Client	
NodeID	The router's own automatically generated ID.
Refresh	Click to regenerate a new Node ID.
ZeroTier Connection	
Name	Customize the name of the connection.
NetworkID	The ZeroTier virtual Ethernet network that the router will join.
Status	Display the status of the connection between the router and the ZeroTier virtual Ethernet network.
Interface Name	Display the name of the virtualized network interface to which the router is added.
Enable	Check to enable this function.

Table 3-2-5-17

Figure 3-2-5-24

Add ZeroTier Connection	
Item	Description
Name	Customize the name of the connection.
Enable	Check to enable this function
NetworkID	The ZeroTier virtual Ethernet network that the device will join.
Interface Name	Displays the name of the virtualized network interface to which the router is added.
Allow Managed Addresses	Allow or disable the ZeroTier controller to dynamically assign IP addresses and configure routing information when the router joins the network.
Allow Assignment of Global IPs	Allow or disallow ZeroTier network controllers to assign worldwide IPv6 addresses.
Allow Default Route Override	Allow or disallow the router to override the default route settings when connecting to the ZeroTier network.

Table 3-2-5-18

3.2.6 IP Passthrough

IP Passthrough mode shares or "passes" the Internet providers assigned IP address to a single LAN client device connected to the router.

Figure 3-2-6-1

IP Passthrough	
Item	Description
Enable	Enable or disable IP Passthrough.
Network Interface	Select network interface from SIM1-APN1, SIM1-APN2 and SIM1-APN3.
Passthrough Mode	Select passthrough mode from DHCPFS-Fixed and DHCPFS-Dynamic.
MAC	Set MAC address when mode is DHCPFS-Fixed.

Table 3-2-6-1 IP Passthrough Parameters

3.2.7 Routing

3.2.7.1 Static Routing

A static routing is a manually configured routing entry. Information about the routing is manually entered rather than obtained from dynamic routing traffic. After setting static routing, the package for the specified destination will be forwarded to the path designated by user.

Destination	Netmask/Prefix Length	Interface	Gateway	Distance	Operation
114.114.114.114	255.255.255.255	LAN1/WAN	192.168.5.1	1	X
8.8.8.8	255.255.255.255	LAN1/WAN	192.168.5.1	1	X
0.0.0.0	0.0.0.0	LAN1/WAN	192.168.5.1	1	X

Figure 3-2-7-1

Static Routing	
Item	Description
Destination	Enter the destination IP address.
Netmask/Prefix Length	Enter the subnet mask or prefix length of destination address.
Interface	The interface through which the data can reach the destination address.
Gateway	IP address of the next router that will be passed by before the input data reaches the destination address.
Distance	Priority, smaller value refers to higher priority. Range: 1-255.

Table 3-2-7-1 Static Routing Parameters

3.2.7.2 Priority Based Routing

Policy-based routing (PBR) is a technique used in computer networks to direct network packets based on defined criteria beyond the standard destination-based routing. Unlike traditional routing, which forwards packets solely based on their destination address, PBR allows to customize routing decisions according to various factors. **Policy-based routing takes precedence over static routing.** With policy-based routing you can implement specific rules or policies to dictate the path that packets should take through the network. This flexibility enables organizations to optimize traffic flow, prioritize certain types of traffic, enforce security measures, and manage network resources more efficiently.

Static Routing	Policy Based Routing	RIP	OSPF	Routing Filtering
Priority	Source Subnet	Outgoing Interface	Destination Subnet	Operation
1	192.168.33.1/24	LAN1/WAN	192.168.34.2/24	
3	192.168.33.1/24	LAN1/WAN	192.168.35.2/24	
4	192.168.35.2/24	SIM1-APN1	192.168.45.2/24	

Figure 3-2-7-2

Priority-Based Routing	
Item	Description
Priority	Set the priority of this policy. The smaller the number, the higher the priority. Valid range: 1–255.
Source Subnet	Traffic that matches the specified source subnet will be applied to this policy. Leave blank if no source subnet matching is required.
Outgoing Interface	Traffic that matches both the source and destination subnets will be forwarded through the selected interface. Policy routing has higher priority than static routing.
Destination Subnet	Traffic that matches the specified destination subnet will be applied to this policy.
Operation	You can add or delete the policy routing configuration.

Table 3-2-7-2 Static Routing Parameters

3.2.7.3 RIP

RIP is mainly designed for small networks. RIP uses Hop Count to measure the distance to the destination address, which is called Metric. In RIP, the hop count from the router to its directly connected network is 0 and the hop count of network to be reached through a router is 1 and so on. In order to limit the convergence time, the specified metric of RIP is an integer in the range of 0 - 15 and the hop count larger than or equal to 16 is defined as infinity, which means that the destination network or host is unreachable. Because of this limitation, the RIP is not suitable for large-scale networks. To improve performance and prevent routing loops, RIP supports split horizon function. RIP also introduces routing obtained by other routing protocols.

Each router that runs RIP manages a routing database, which contains routing entries to reach all reachable destinations.

Figure 3-2-7-3

RIP	
Item	Description
Enable	Enable or disable RIP.
Update Timer	It defines the interval to send routing updates. Range: 5-2147483647, in seconds.
Timeout Timer	It defines the routing aging time. If no update package on a routing is received within the aging time, the routing's Routing Cost in the routing table will be set to 16. Range: 5-2147483647, in seconds.

Garbage Collection Timer	It defines the period from the routing cost of a routing becomes 16 to it is deleted from the routing table. In the time of Garbage-Collection, RIP uses 16 as the routing cost for sending routing updates. If Garbage Collection times out and the routing still has not been updated, the routing will be completely removed from the routing table. Range: 5-2147483647, in seconds.
Version	RIP version. The options are v1 and v2.
Advanced Settings	
Default Information Originate	Default information will be released when this function is enabled.
Default Metric	The default cost for the router to reach destination. Range: 0-16
Redistribute Connected	Check to enable.

Authentication String	The authentication key for package interaction in RIPV2.
Authentication Key-chain	The authentication key-chain for package interaction in RIPV2.
Neighbor	
IP Address	Set RIP neighbor's IP address manually.
Network	
IP Address	The IP address of interface for RIP publishing.
Netmask	The netmask of interface for RIP publishing.

Table 3-2-7-4

3.2.7.4 OSPF

OSPF, short for Open Shortest Path First, is a link status based on interior gateway protocol developed by IETF.

If a router wants to run the OSPF protocol, there should be a Router ID that can be manually configured. If no Router ID configured, the system will automatically select an IP address of interface as the Router ID. The selection order is as follows:

- If a Loopback interface address is configured, then the last configured IP address of Loopback interface will be used as the Router ID;
- If no Loopback interface address is configured, the system will choose the interface with the biggest IP address as the Router ID.

Five types of packets of OSPF:

- **Hello packet**

- **DD packet** (Database Description Packet)
- **LSR packet** (Link-State Request Packet)
- **LSU packet** (Link-State Update Packet)
- **LSAck packet** (Link-Sate Acknowledgment Packet)

Neighbor and Neighboring

After OSPF router starts up, it will send out Hello Packets through the OSPF interface. Upon receipt of Hello packet, OSPF router will check the parameters defined in the packet. If it's consistent, a neighbor relationship will be formed. Not all matched sides in neighbor relationship can form the adjacency relationship. It is determined by the network type. Only when both sides successfully exchange DD packets and LSDB synchronization is achieved, the adjacency in the true sense can be formed. LSA describes the network topology around a router, LSDB describes entire network topology.

Figure 3-2-7-5

OSPF	
Item	Description
Enable	Enable or disable OSPF.
Router ID	Router ID (IP address) of the originating LSA.
ABR Type	Select from cisco, ibm, standard and shortcut.
RFC1583 Compatibility	Enable/Disable.
OSPF Opaque-LSA	Enable/Disable LSA: a basic communication means of the OSPF routing protocol for the Internet Protocol (IP).
SPF Delay Time	Set the delay time for OSPF SPF calculations. Range: 0-6000000, in milliseconds.

SPF Initial-holdtime	Set the initialization time of OSPF SPF. Range: 0-6000000, in milliseconds.
SPF Max-holdtime	Set the maximum time of OSPF SPF. Range: 0-6000000, in milliseconds.
Reference Bandwidth	Range: 1-4294967, in Mbit.

Table 3-2-7-5 OSPF Parameters

Interface

Interface	Hello Interval(s)	Dead Interval(s)	Retransmit Interval(s)	Transmit Delay(s)	Operation

Interface Advanced Options

Interface	Network	Cost	Priority	Authentication	Key ID	Key	Operation
Bridge	broad	10	1				<input type="button" value="X"/> <input type="button" value="+"/>

Figure 3-2-7-6

Item	Description
Interface	
Interface	Select interface from "cellular0", "WAN" and "Bridge0".
Hello Interval (s)	Send interval of Hello packet. If the Hello time between two adjacent routers is different, the neighbour relationship cannot be established. Range: 1-65535.
Dead Interval (s)	Dead Time. If no Hello packet is received from the neighbours within the dead time, then the neighbour is considered failed. If dead times of two adjacent routers are different, the neighbour relationship cannot be established.
Retransmit Interval (s)	When the router notifies an LSA to its neighbour, it is required to make acknowledgement. If no acknowledgement packet is received within the retransmission interval, this LSA will be retransmitted to the neighbour. Range: 3-65535.
Transmit Delay (s)	It will take time to transmit OSPF packets on the link. So a certain delay time should be increased before transmission the aging time of LSA. This configuration needs to be further considered on the low-speed link. Range: 1-65535.
Interface Advanced Options	
Interface	Select interface.
Network	Select OSPF network type.
Cost	Set the cost of running OSPF on an interface. Range: 1-65535.
Priority	Set the OSPF priority of interface. Range: 0-255.
Authentication	Set the authentication mode that will be used by the OSPF area.

	Simple: a simple authentication password should be configured and confirmed again. MD5: MD5 key & password should be configured and confirmed again.
Key ID	It only takes effect when MD5 is selected. Range 1-255.
Key	The authentication key for OSPF packet interaction.

Table 3-2-7-6 OSPF Parameters

Figure 3-2-7-10

Routing Filtering	
Item	Description
Access Control List	
Name	User-defined name, need to start with a letter. Only letters, digits and underline (_) are allowed.
Action	Select from "permit" and "deny".
Match Any	No need to set IP address and subnet mask.
IP Address	User-defined.
Netmask	User-defined.
IP Prefix-List	
Name	User-defined name, need to start with a letter. Only letters, digits and underline (_) are allowed.
Sequence Number	A prefix name list can be matched with multiple rules. One rule is matched with one sequence number. Range: 1-4294967295.
Action	Select from "permit" and "deny".
Match Any	No need to set IP address, subnet mask, FE Length, and LE Length.
IP Address	User-defined.
Netmask	User-defined.
FE Length	Specify the minimum number of mask bits that must be matched. Range: 0-32.
LE Length	Specify the maximum number of mask bits that must be matched. Range: 0-32.

Table 3-2-7-10 Routing Filtering Parameters

3.2.8 VRRP

The Virtual Router Redundancy Protocol (VRRP) is a computer networking protocol that provides automatic assignment of available Internet Protocol (IP) routers for participating hosts. This increases the availability and reliability of routing paths via automatic default gateway selections in an IP sub-network.

Increasing the number of exit gateway is a common method for improving system reliability. VRRP adds a group of routers that undertake gateway function into a backup group so as to form a virtual router. The election mechanism of VRRP will decide which router undertakes the forwarding task, and the host in LAN is only required to configure the default gateway for the virtual router.

In VRRP, routers need to be aware of failures in the virtual master router. To achieve this, the virtual master router sends out multicast "alive" announcements to the virtual backup routers in the same VRRP group.

The VRRP router who has the highest number will become the virtual master router. The VRRP router number ranges from 1 to 255 and usually we use 255 for the highest priority and 100 for backup.

If the current virtual master router receives an announcement from a group member (Router ID) with a higher priority, then the latter will pre-empt and become the virtual master router.

VRRP has the following characteristics:

- The virtual router with an IP address is known as the Virtual IP address. For the host in LAN, it is only required to know the IP address of virtual router, and set it as the address of the next hop of the default route.
- The network Host communicates with the external network through this virtual router.

- A router will be selected from the set of routers based on its priority to undertake the gateway function. Other routers will be used as backup routers to perform the duties of gateway for the gateway router in the case of any malfunction, so as to guarantee uninterrupted communication between the host and external network.

When interface connected with the uplink is at the state of Down or Removed, the router actively lowers its priority so that priority of other routers in the backup group will be higher. Thus the router with the highest priority becomes the gateway for the transmission task.

Figure 3-2-8-1

VRRP		
Item	Description	Default
Enable	Enable or disable VRRP.	Disable
Interface	Select the interface of Virtual Router.	None
Virtual Router ID	User-defined Virtual Router ID. Range: 1-255.	None
Virtual IP	Set the IP address of Virtual Router.	None
Priority	The VRRP priority range is 1-254 (a bigger number indicates a higher priority). The router with higher priority will be more likely to become the gateway router.	100
Advertisement Interval (s)	Heartbeat package transmission time interval between routers in the virtual ip group. Range: 1-255.	1
Preemption Mode	If the router works in the preemption mode, once it finds that its own priority is higher than that of the current gateway router, it will send VRRP notification package, resulting in re-election of gateway router and eventually	Disable

	replacing the original gateway router. Accordingly, the original gateway router will become a Backup router.	
IPV4 Primary Server	The router will send ICMP packet to the IP address or host name to determine whether the Internet connection is still available or not.	8.8.8.8
IPV4 Secondary Server	The router will try to ping the secondary server name if primary server is not available.	223.5.5.5
Interval	Time interval (in seconds) between two Pings.	300
Retry Interval	Set the ping retry interval. When ping failed, the router will ping again every retry interval.	5
Timeout	The maximum amount of time the router will wait for a response to a ping request. If it does not receive a response for the amount of time defined in this field, the ping request will be considered as failure.	3
Max Ping Retries	The retry times of the router sending ping request until determining that the connection has failed.	3

3.2.9 DDNS

Dynamic DNS (DDNS) is a method that automatically updates a name server in the Domain Name System, which allows user to alias a dynamic IP address to a static domain name.

DDNS serves as a client tool and needs to coordinate with DDNS server. Before starting configuration, user shall register on a website of proper domain name provider and apply for a domain name.

3.3 System

3.3.1 General Settings

3.3.1.1 General

General settings include system info and HTTPS certificates.

The screenshot shows a web-based configuration interface for a Milesight router. It is divided into two main sections: 'System' and 'HTTPS Certificates'.
 In the 'System' section, there are three settings:
 - 'Hostname': A text input field containing 'ROUTER'.
 - 'Web Login Timeout(s)': A text input field containing '1800'.
 - 'Encrypting Cleartext Passwords': A checkbox that is checked.
 In the 'HTTPS Certificates' section, there are two rows of settings:
 - 'Certificate': A text input field containing 'https.crt', followed by four buttons: 'Browse' (blue), 'Import' (grey), 'Export' (blue), and 'Delete' (blue).
 - 'Key': A text input field containing 'https.key', followed by four buttons: 'Browse' (blue), 'Import' (grey), 'Export' (blue), and 'Delete' (blue).
 At the bottom of the form is a large blue 'Save' button.

Figure 3-3-1-1

General		
Item	Description	Default
System		
Hostname	User-defined router name, needs to start with a letter.	ROUTER
Web Login Timeout (s)	You need to log in again if it times out. Range: 100-3600.	1800
Encrypting Cleartext Passwords	This function will encrypt all of cleartext passwords into ciphertext passwords.	Enable
HTTPS Certificates		
Certificate	Click "Browse" button, choose certificate file on the PC, and then click "Import" button to upload the file into router. Click "Export" button will export the file to the PC. Click "Delete" button will delete the file.	--
Key	Click "Browse" button, choose key file on the PC, and then click "Import" button to upload the file into router. Click "Export" button will export file to the PC. Click "Delete" button will delete the file.	--

Table 3-3-1-1 General Setting Parameters

3.3.1.2 System Time

This section explains how to set the system time including time zone and time synchronization type.

Note: to ensure that the router runs with the correct time, it's recommended that you set the system

time when configuring the router.

The screenshot displays the 'System Time Settings' configuration page. It includes a 'Current Time' field showing '2025-12-26 13:49:01 Fri'. Below it, 'Autp DST' is checked with a blue checkbox. 'Time Zone' is a dropdown menu currently showing '0 United Kingdom (London)'. 'Sync Type' is another dropdown menu showing 'Sync with NTP Server'. 'Primary NTP Server' is a text input field containing 'pool.ntp.org'. 'Secondary NTP Server' is an empty text input field. Under the 'NTP Server' section, there is an 'Enable NTP Server' checkbox which is currently unchecked. A blue 'Save' button is located at the bottom left of the settings area.

Figure 3-3-1-2

System Time	
Item	Description
Current Time	Show the current system time.
Autp DST	Enable to use the daylight saving time.
Time Zone	Click the drop down list to select the time zone you are in.
Sync Type	Click the drop down list to select the time synchronization type. Sync with Browser: Synchronize time with browser. Sync with NTP Server: Synchronize time with NTP Server. Set up Manually: configure the time manually. Sync with Cellular Operator: Synchronize time with cellular operator. This only works when the device has registered to cellular network.
Sync with Browser	Synchronize time with browser.
Browser Time	Show the current time of browser.
Set up Manually	Manually configure the system time.
Primary NTP Server	Enter primary NTP Server's IP address or domain name.
Secondary NTP Server	Enter secondary NTP Server's IP address or domain name.
NTP Server	
Enable NTP Server	NTP client on the network can achieve time synchronization with router after this option is checked.

3.3.3 User Management

3.3.3.1 Account

Here you can change the login username and password of the administrator.

Note: it is strongly recommended that you modify them for the sake of security.

Figure 3-3-3-1

Account	
Item	Description
Username	Enter a new username. You can use characters such as a-z, 0-9, "_", "-". The first character can't be a digit.
Old Password	Enter the old password.
New Password	Enter a new password. You can use any ASCII characters except blank. The password must contain at least one letter and one number, with a length of 5-31 characters.
Confirm New Password	Enter the new password again.

Table 3-3-3-1 Account Settings

3.3.3.2 User Management

This section describes how to create common user accounts. The common user permission includes Read-Only and Read-Write.

Figure 3-3-3-2

User Management	
Item	Description
Username	Enter a new username. You can use characters such as a-z, 0-9, "_", "-". The first character can't be a digit.
Password	Set password. You can use any ASCII characters except blank. The password must

	contain at least one letter and one number, with a length of 5-31 characters.
Permission	Select user permission from "Read-Only" and "Read-Write". Read-Only: users can only view the configuration of router in this level. Read-Write: users can view and set the configuration of router in this level.

Table 3-3-3-2 User Management

3.3.4 AAA

AAA access control is used for visitors control and the available corresponding services once access is allowed. It adopts the same method to configure three independent safety functions. It provides modularization methods for following services:

- Authentication: verify if the user is qualified to access to the network.
- Authorization: authorize related services available for the user.
- Charging: record the utilization of network resources.

3.3.4.1 Radius

Using UDP for its transport, Radius is generally applied in various network environments with higher requirements of security and permission of remote user access.

Figure 3-3-4-1

Radius	
Item	Description
Enable	Enable or disable Radius.
Server IP Address	Fill in the Radius server IP address/domain name.
Server Port	Fill in the Radius server port. Range: 1-65535.
Key	Fill in the key consistent with that of Radius server in order to get connected with Radius server.

Table 3-3-4-1 Radius Parameters

3.3.4.2 TACACS+

Using TCP for its transport, TACACS+ is mainly used for authentication, authorization and charging of

the access users and terminal users by adopting PPP and VPDN.

Figure 3-3-4-2

TACACS+	
Item	Description
Enable	Enable or disable TACACS+.
Server IP Address	Fill in the TACACS+ server IP address/domain name.
Server Port	Fill in the TACACS+ server port. Range: 1-65535.
Key	Fill in the key consistent with that of TACACS+ server in order to get connected with TACACS+ server.

Table 3-3-4-2 TACACS+ Parameters

3.3.4.3 LDAP

A common usage of LDAP is to provide a central place to store usernames and passwords. This allows many different applications and services to connect the LDAP server to validate users.

LDAP is based on a simpler subset of the standards contained within the X.500 standard. Because of this relationship, LDAP is sometimes called X.500-lite as well.

Figure 3-3-4-3

LDAP	
Item	Description
Enable	Enable or Disable LDAP.
Server IP Address	Fill in the LDAP server's IP address/domain name. The maximum count is 10.
Server Port	Fill in the LDAP server's port. Range: 1-65535
Base DN	The top of LDAP directory tree.
Security	Select secure method from "None", "StartTLS" and "SSL".
Username	Enter the username to access the server.
Password	Enter the password to access the server.

Table 3-3-5-3 LDAP Parameters

3.3.4.4 Authentication

AAA supports the following authentication ways:

- None: uses no authentication, generally not recommended.
- Local: uses the local username database for authentication.
 - Advantages: rapidness, cost reduction.
 - Disadvantages: storage capacity limited by hardware.
- Remote: has user's information stored on authentication server. Radius, TACACS+ and LDAP supported for remote authentication.

When radius, TACACS+, and local are configured at the same time, the priority level is: 1 > 2 > 3.

Events	Select the type of event that needs to be MQTT forwarded.
MQTT	Select the MQTT connection used for forwarding the current event type.
Topic	Define the topic name of the forwarding event, which is used by the router to forward data when the event is triggered.
Retain Flag	Enable to set the latest message of this topic as retain message.
QoS	<p>QoS 0 – Only Once</p> <p>This is the fastest method and requires only 1 message. It is also the most unreliable transfer mode.</p> <p>QoS 1 – At Least Once</p>

This level guarantees that the message will be delivered at least once, but may be delivered more than once.

QoS 2 – Exactly Once

QoS 2 is the highest level of service in MQTT. This level guarantees that each message is received only once by the intended recipients. QoS 2 is the safest and slowest quality of service level.

Table 3-3-6-3

3.4 Service

3.4.1 MQTT

UR32L supports to work as MQTT client to forward data and router information to MQTT broker in two ways:

1. Users send requests to the router to enquire the router information;
2. The router publishes the data automatically.

The screenshot shows a web interface for MQTT connections. At the top, there is a tab labeled 'MQTT'. Below it, a section titled 'Connections' contains a table with the following data:

ID	Name	Address	Status	Operation
1	mqtttest1	192.168.44.54:1883	Connected	 
2	555	666:1883	Disconnected

System Status	<input type="text" value="/systemstatus"/>	<input type="text" value="60"/>	<input checked="" type="checkbox"/>	<input type="text" value="QoS 0"/>
Cellular	<input type="text" value="/cellular"/>	<input type="text" value="60"/>	<input checked="" type="checkbox"/>	<input type="text" value="QoS 0"/>
Ethernet	<input type="text" value="/ethernet"/>	<input type="text" value="60"/>	<input checked="" type="checkbox"/>	<input type="text" value="QoS 0"/>

Figure 3-4-1-3

MQTT Settings	
Item	Description
Status	Show connection status between router and MQTT broker.
General	
Name	Customize a unique connection name. It is not allowed to change after save.
Enable	Enable or disable this MQTT connection.
Broker Address	MQTT broker address to receive data.
Broker Port	MQTT broker port to receive data.
Client ID	Client ID is the unique identity of the client to the server. It must be unique when all clients are connected to the same server, and it is the key to handle messages at QoS 1 and 2.
Connection Timeout/s	If the client does not get a response after the connection timeout, the connection will be considered as broken. The Range: 1-65535.
Keep Alive Interval/s	After the client is connected to the server, the client will send heartbeat packet to the server regularly to keep alive. Range: 1-65535.
Auto Reconnect	When connection is broken, try to reconnect the server automatically.

Reconnect Period	When connection is broken, the period to reconnect the server periodically.
Clean Session	When enabled, the connection will create a temporary session and all information will lose when the client is disconnected from broker; when disabled, the connection will create a persistent session that will remain and save offline messages until the session logs out overtime.
User Credentials	
Enable	Enable user credentials.
Username	The username used for connecting to the MQTT broker.
Password	The password used for connecting to the MQTT broker.
TLS	
Enable	Enable the TLS encryption in MQTT communication.
Mode	Select from Self signed certificates, CA signed server certificate. CA signed server certificate: verify with the certificate issued by Certificate Authority (CA) that pre-loaded on the device. Self signed certificates: upload the custom CA certificates, client certificates and secret key for verification.
Last Will and Testament	
Enable	Last will message is automatically sent when the MQTT client is abnormally disconnected. It is usually used to send device status information or inform other devices or proxy servers of the device's offline status.
Last-Will Topic	Customize the topic to receive last will messages.
Last-Will QoS	QoS0, QoS1 or QoS2 are optional.
Last-Will Retain	Enable to set last will message as retain message.
Last-Will Payload	Customize the last will message contents.
Request and Response Topic	
Topic	The router supports to send requests to enquire router information. Status Request: users is able to send requests to this topic to enquire router information. Request format: <pre>{ "id": "1", "status": "systeminfo", "sn": "64E1213132456", "need_response": 1 //1 means need response }</pre> The id is a random value, and the status can be set as 4 types: systeminfo, systemstatus, cellular, ethernet. Status Response: users is able to subscribe this topic to get the replies.
Retain	Enable to set the latest message of this topic as retain message.
QoS	QoS0, QoS1 or QoS2 are optional.
System Status Publish Topic	
Data Type	Data type sent to MQTT broker automatically.

Topic	Topic name of the data type used for publishing.
Publish Interval (s)	The interval to publish data to MQTT broker automatically.
Retain	Enable to set the latest message of this topic as retain message.
QoS	QoS0, QoS1 or QoS2 are optional.

Table 3-4-1-1 MQTT Parameters

3.4.2 SNMP

SNMP is widely used in network management for network monitoring. SNMP exposes management data with variables form in managed system. The system is organized in a management information base (MIB) which describes the system status and configuration. These variables can be remotely queried by managing applications.

Configuring SNMP in networking, NMS, and a management program of SNMP should be set up at the Manager.

Configuration steps are listed as below for achieving query from NMS:

1. Enable SNMP setting.
2. Download MIB file and load it into NMS.
3. Configure MIB View.
4. Configure VCAM.

Related Configuration Example

[SNMP Application Example](#)

3.4.2.1 SNMP

UR32L supports SNMPv1, SNMPv2c and SNMPv3 version. SNMPv1 and SNMPv2c employ community name authentication. SNMPv3 employs authentication encryption by username and password.

The screenshot shows a web configuration interface for SNMP. At the top, there are five tabs: 'SNMP' (selected), 'MIB View', 'VACM', 'Trap', and 'MIB'. Below the tabs is the 'SNMP Settings' section. It contains the following fields:

- Enable:** A checkbox that is checked.
- Port:** A text input field containing the value '161'.
- SNMP Version:** A dropdown menu showing 'SNMPv2'.
- Location Information:** A text input field containing the value '225_location'.
- Contact Information:** A text input field containing the value '225_Contact'.

At the bottom of the settings area, there is a blue 'Save' button.

Figure 3-4-2-1

SNMP Settings	
Item	Description
Enable	Enable or disable SNMP function.
Port	Set SNMP listened port. Range: 1-65535. The default port is 161.
SNMP Version	Select SNMP version; support SNMP v1/v2c/v3.
Location Information	Fill in the location information.
Contact Information	Fill in the contact information.

Table 3-4-2-1 SNMP Parameters

3.4.2.2 MIB View

This section explains how to configure MIB view for the objects.

View Name	View Filter	View OID	Operation
All	Included	1	X
system	Included	1.3.6.1.2.1.1	X
			+

Figure 3-4-2-2

MIB View	
Item	Description
View Name	Set MIB view's name.
View Filter	Select from "Included" and "Excluded".
View OID	Enter the OID number.
Included	You can query all nodes within the specified MIB node.
Excluded	You can query all nodes except for the specified MIB node.

Table 3-4-2-2 MIB View Parameters

3.4.2.3 VACM

This section describes how to configure VCAM parameters.

Community	Permission	MIB View	Network	Operation
private	Read-Write	All	0.0.0.0/0	X
public	Read-Write	All	0.0.0.0/0	X
				+

Figure 3-4-2-3

VACM	
Item	Description
SNMP v1 & v2 User List	
Community	Set the community name.
Permission	Select from "Read-Only" and "Read-Write".
MIB View	Select an MIB view to set permissions from the MIB view list.
Network	The IP address and bits of the external network accessing the MIB view.
Read-Write	The permission of the specified MIB node is read and write.
Read-Only	The permission of the specified MIB node is read only.
SNMP v3 User Group	
Group Name	Set the name of SNMPv3 group.
Security Level	Select from "NoAuth/NoPriv", "Auth/NoPriv", and "Auth/Priv".
Read-Only View	Select an MIB view to set permission as "Read-only" from the MIB view list.
Read-Write View	Select an MIB view to set permission as "Read-write" from the MIB view list.
Inform View	Select an MIB view to set permission as "Inform" from the MIB view list.
SNMP v3 User List	
Username	Set the name of SNMPv3 user.
Group Name	Select a user group to be configured from the user group.
Authentication	Select from "MD5", "SHA", and "None".
Authentication Password	The password should be filled in if authentication is "MD5" and "SHA".
Encryption	Select from "AES", "DES", and "None".
Encryption Password	The password should be filled in if encryption is "AES" and "DES".

Table 3-4-2-3 VACM Parameters

3.4.2.4 Trap

This section explains how to enable network monitoring by SNMP trap.

The screenshot displays the configuration page for SNMP Traps. At the top, there are navigation tabs: 'SNMP', 'MIB View', 'VACM', 'Trap' (which is the active tab), and 'MIB'. Below the tabs, the 'SNMP Trap' section is shown with the following settings:

- Enable:** A checkbox that is checked.
- SNMP Version:** A dropdown menu currently set to 'SNMPv2'.
- Server Address:** An empty text input field.
- Port:** An empty text input field.
- Name:** An empty text input field.

Figure 3-4-2-4

SNMP Trap	
Item	Description
Enable	Enable or disable SNMP Trap function.
SNMP Version	Select SNMP version; support SNMP v1/v2c/v3.
Server Address	Fill in NMS's IP address or domain name.
Port	Fill in UDP port. Port range is 1-65535. The default port is 162.
Name	Fill in the group name when using SNMP v1/v2c; fill in the username when using SNMP v3.
Auth/Priv Mode	Select from "NoAuth & No Priv", "Auth & NoPriv", and "Auth & Priv".

Table 3-4-2-4 Trap Parameters

3.4.2.5 MIB

This section describes how to download MIB files. The last MIB file "LTE-ROUTER-MIB.txt" is for the UR32L router.

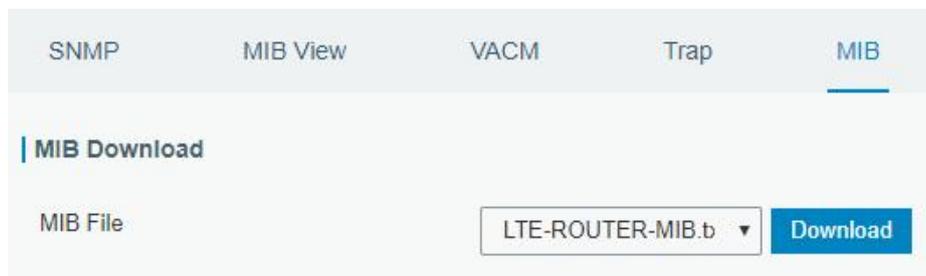

Figure 3-4-2-5

MIB	
Item	Description
MIB File	Select the MIB file you need.
Download	Click "Download" button to download the MIB file to PC.

3.5.3 Log

The system log contains a record of informational, error and warning events that indicates how the system processes. By reviewing the data contained in the log, an administrator or user troubleshooting the system can identify the cause of a problem or whether the system processes are loading successfully. Remote log server is feasible, and router will upload all system logs to remote log server such as Syslog Watcher.

3.5.3.1 System Log

3.5.4 Upgrade

This section describes how to upgrade the router firmware via web. Generally you don't need to do the firmware upgrade.

Note: any operation on web page is not allowed during firmware upgrade, otherwise the upgrade will be interrupted, or even the device will break down.

The screenshot shows a web interface for upgrading firmware. At the top, there is a tab labeled 'Upgrade'. Below it, the current 'Firmware Version' is displayed as '32.3.0.1'. There is a checkbox for 'Reset Configuration to Factory Default'. Underneath, the 'Upgrade Firmware' section contains a text input field with the path 'C:\fakepath\32.3.0.2.bin', a 'Browse' button, and an 'Upgrade' button.

Figure 3-5-4-1

Upgrade	
Item	Description
Firmware Version	Show the current firmware version.
Reset Configuration to Factory Default	When this option is checked, the router will be reset to factory defaults after upgrade.
Upgrade Firmware	Click "Browse" button to select the new firmware file, and click "Upgrade" to upgrade firmware.

Related Configuration Example

[Firmware Upgrade](#)

3.5.5 Backup and Restore

This section explains how to create a complete backup of the system configurations to a file, restore the config file to the router and reset to factory defaults.

The screenshot shows a web interface for restoring configurations. It has three main sections: 'Restore Config' with a 'Config File' input field, 'Browse', and 'Import' buttons; 'Backup Running-config' with 'Full Backup' and 'Partial Backup' buttons; and 'Restore Factory Defaults' with a 'Reset' button.

Figure 3-5-5-1

Backup and Restore	
Item	Description
Config File	Click "Browse" button to select configuration file, and then click "Import" button to upload the configuration file to the router.
Full Backup	Export the all configurations file to the PC.
Partial Backup	Export all configurations except for the following pages to the PC. Configurations not included in partial backup: <ul style="list-style-type: none"> ● Network → Interfaces → WAN: All configurations ● Network → Interfaces → WLAN: Configurations when set to AP mode ● System → User Management: All configurations ● System → Device Management → Device Management: Configurations when DeviceHub is selected and activated via authorization code ● System → Device Management → MilesightVPN: All configurations
Reset	Click "Reset" button to reset factory default settings. Router will restart after reset process is done.

Chapter 4 Application Examples

4.1 Network Connection

4.1.1 Cellular Connection

1. Ensure the SIM card is inserted well before powering on and all cellular antennas are connected to the correct connectors.
2. Go to **Network > Interface > Cellular > SIM Setting** to configure the SIM info, then click  to configure the cellular interfaces, click **OK** to save configuration.

SIM1							SIM Setting
Interface Name	Status	Network Type	IP	APN	Enable Status	Operation	
SIM1-APN1	Connect Successfully	Auto	10.125.133.127/2408.8448.2003.a...	ctnet2	<input checked="" type="checkbox"/>		
SIM1-APN2	Connect Successfully	Auto	10.130.90.197/2408.8448.2000.47...	ctnet	<input checked="" type="checkbox"/>		
SIM1-APN3	-	Auto	-	ctnet4	<input type="checkbox"/>		

3. Go to **Network > Interface > Link Failover** to enable correspond SIM and drag buttons to change link priority.

Link Priority								
Priority	Enable Rule	Link in use	Interface	Connection Type	IP	Operation		
1	<input checked="" type="checkbox"/>	●	SIM1-APN1	DHCP	-			
2	<input checked="" type="checkbox"/>	●	SIM2-APN1	DHCP	-			
3	<input checked="" type="checkbox"/>	●	WAN	Static	192.168.40.117			

4. Click  to configure ICMP ping detection information. When ping probe is enabled, the router will send ICMP packets to detection server to check if this link is valid. If no response and exceeding max retries, it will switch to the lower priority link.

Note: if you use private SIM card, please change a private server address or disable the ping probe.

4.2 OpenVPN Client Application Example

UR32L routers can work as OpenVPN clients or OpenVPN servers. We are about to take an example of configuring an OpenVPN client to connect to OpenVPN CloudConnexa.

Configuration Steps

1. Ensure the UR32L has gotten access to the Internet.
2. Log in the CloudConnexa account, select the Network section and select the service depending on your requirement and follow the wizard to continue the settings.

Select Network Scenarios

Please select all applicable scenarios for the network you are going to create.

Remote Access ?

Connect your private resources to CloudConnexa. Provide remote access to your resources, which are hosted on IaaS Cloud, and on premises resources.

[Read more](#)

Site-to-site ?

Connect multiple private networks to CloudConnexa (site-to-site connectivity). This wizard will assist you in adding a single network. You can use this wizard to connect all of your networks.

[Read more](#)

Secure Internet Access ?

Provide secure access to public resources. Use this network as an Internet Gateway for all internet traffic or only for selected public resources. You can then apply whitelisting rules to your public resources.

[Read more](#)

If you would like to connect a single server you can create a [host](#) and connect your server directly to CloudConnexa

Skip Wizard

Continue

3. Select the provider type as OpenWrt and download the OVPN file.

Deploy Network Connector (connector01)

Connector Details

Name

connector01

4.3 NAT Application Example

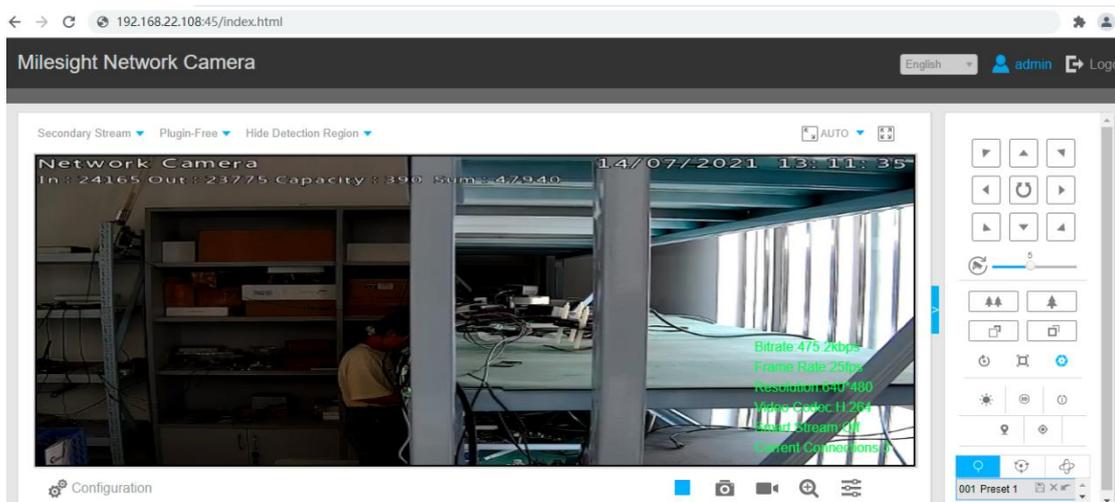

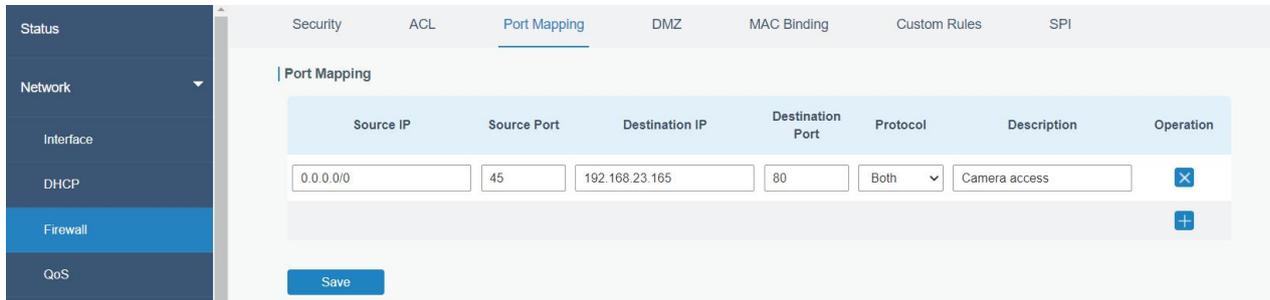

Example

An UR32L router can access to the Internet via cellular and get a public IP address. LAN port is connected with an IP camera whose IP address is 192.168.23.165 and HTTP port is 80. This IP camera can be accessed by public IP address via the below port mapping settings.

Configuration Steps

Go to **Firewall > Port Mapping** and configure port mapping parameters as below. Source IP address 0.0.0.0/0 means all external addresses are allowed to access. After that, users can use public IP: external port to access the IP camera.

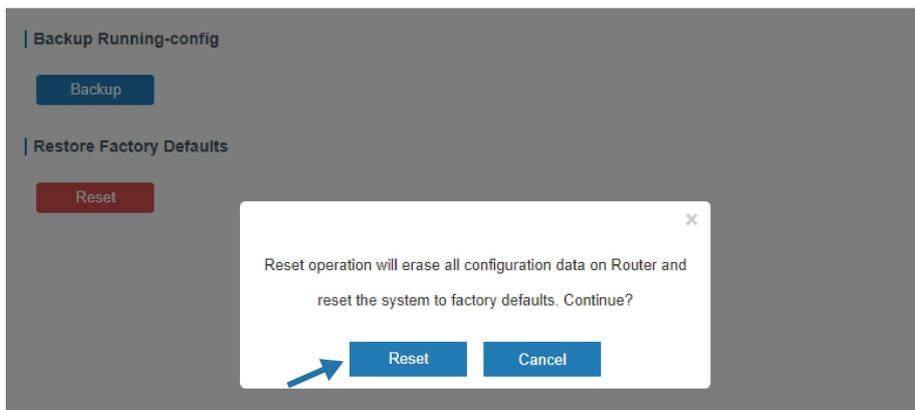

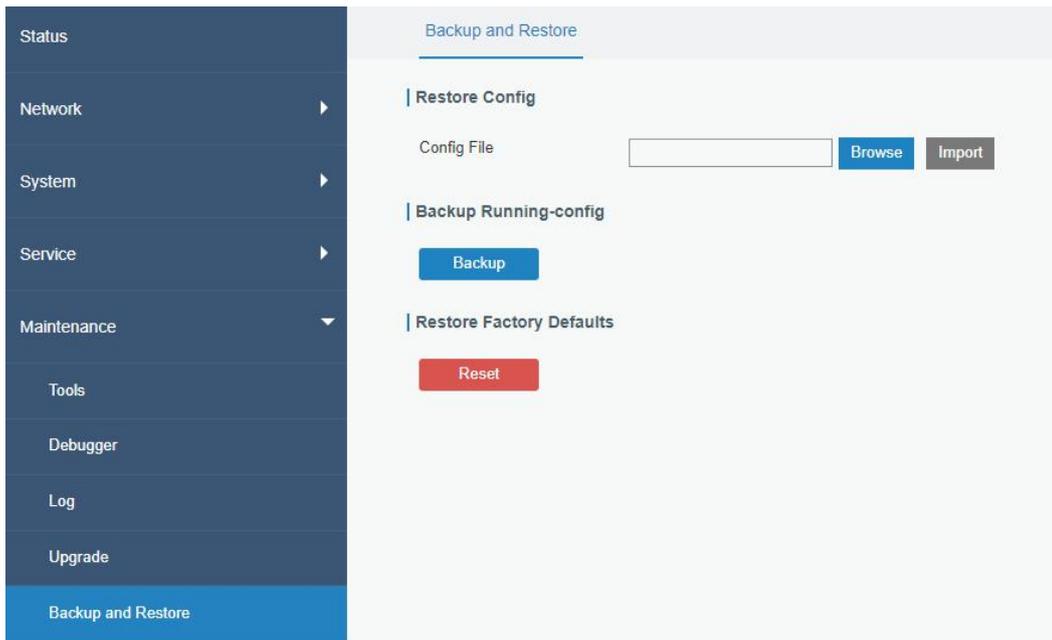

Related Topic

[Port Mapping](#)

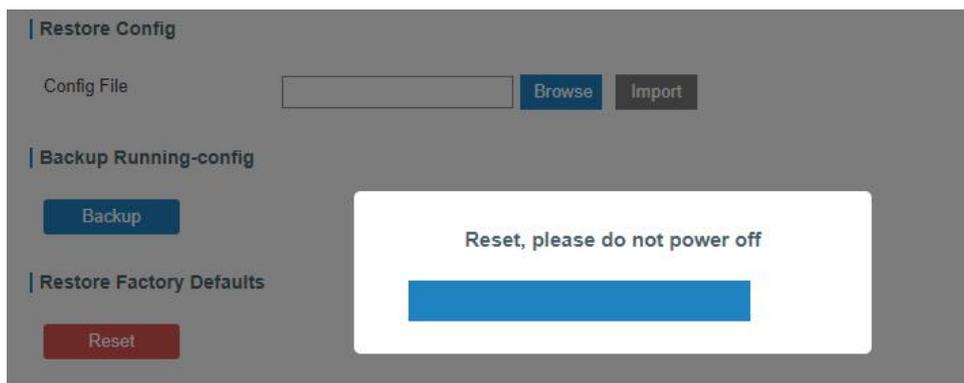

4.4 Restore Factory Defaults

Method 1:

Log in web interface, and go to **Maintenance > Backup and Restore**, click **Reset** button. You will be asked to confirm if you'd like to reset it to factory defaults. Then click **Reset** button.

Then the router will reboot and restore to factory settings immediately.

Please wait till the SYSTEM LED blinks slowly and login page pops up again, which means the router has already been reset to factory defaults successfully.

[Restore Factory Defaults](#)

Method 2:

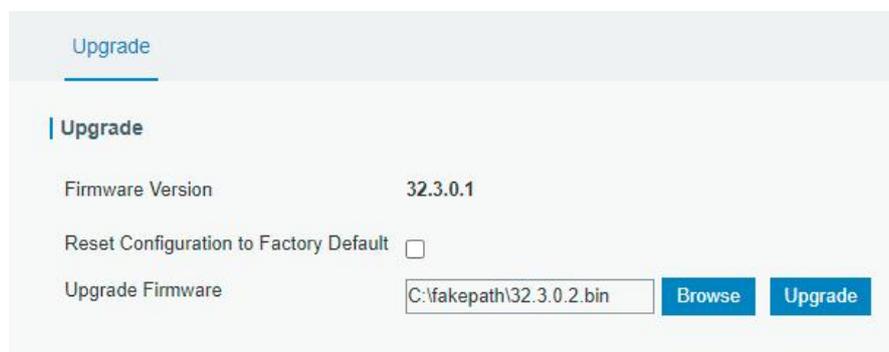

Locate the reset button on the router, press and hold the reset button for more than 5s until the LED blinks.

4.5 Firmware Upgrade

It is suggested that you contact Milesight technical support first before you upgrade router firmware. After getting firmware file please refer to the following steps to complete the upgrade.

1. Go to **Maintenance > Upgrade**, click **Browse** and select the correct firmware file from the PC.
2. Click **Upgrade** and the router will check if the firmware file is correct. If it's correct, the firmware will be imported to the router, and then the router will start to upgrade.

Note: It is recommended to check the box of Reset Configuration to Factory Default before upgrade.

4.6 SNMP Application Example

Before you configure SNMP parameters, please download the relevant MIB file from the UR32L's WEB GUI first, and then upload it to any software or tool which supports standard SNMP protocol. Here we take ManageEngine MibBrowser Free Tool as an example to access the router to query cellular information.

1. Go to **Service > SNMP > MIB** and download the MIB file **LTE-ROUTER-MIB.txt** to PC.

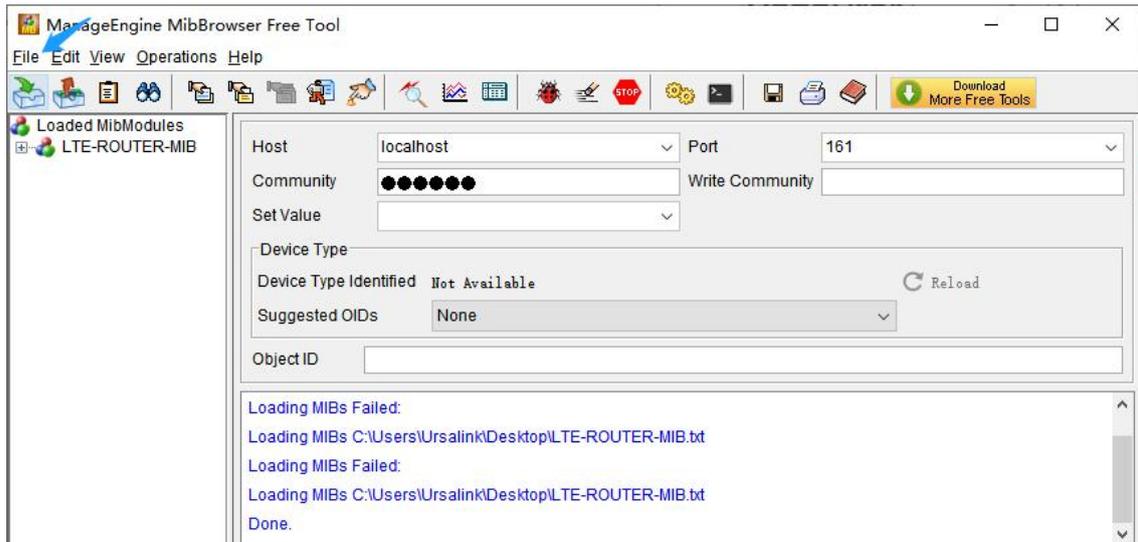

SNMP MIB View VACM Trap MIB

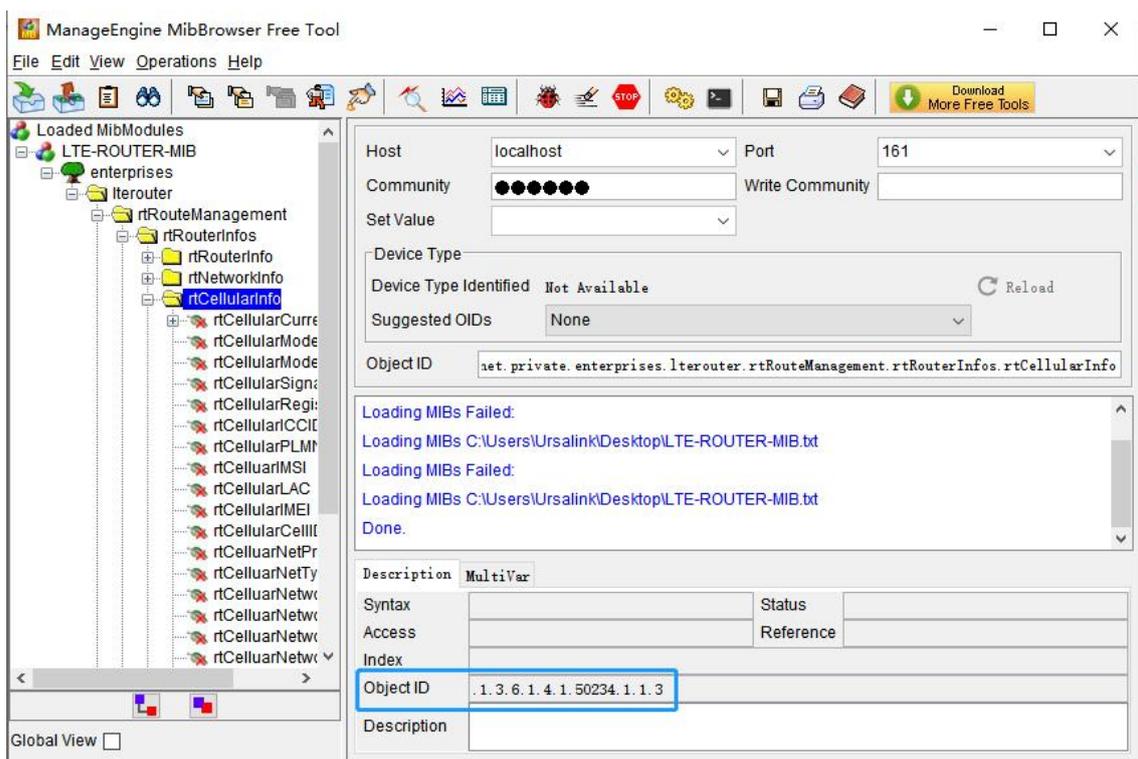

MIB Download

MIB File LTE-ROUTER-MIB.txt

2. Start ManageEngine MibBrowser Free Tool on the PC. Click **File > Load MIB** on the menu bar. Then select **LTE-ROUTER-MIB.txt** file from PC and upload it to the software.

Click the “+” button beside LTE-ROUTER-MIB, which is under the **Loaded MibModules** menu, and find **usCellularinfo**. And then you will see the OID of cellular info is “.1.3.6.1.4.1.50234”, which will be filled in the MIB View settings.

3. Go to **Service > SNMP > SNMP** to enable SNMP feature.

SNMP MIB View VACM Trap MIB

SNMP Settings

Enable

Port

SNMP Version

Location Information

Contact Information

4. Click  to add a new MIB view and define the view to be accessed from the outside network. Then click "Save" button.

SNMP MIB View VACM Trap MIB

View List

View Name	View Filter	View OID	Operation
<input type="text" value="cellular"/>	<input type="text" value="Included"/>	<input type="text" value="1.3.6.1.4.1.50234.1.3"/>	<input type="button" value="x"/> <input type="button" value="+"/>

5. Click  to add a new VACM setting to define the access authority for the specified view from the specified outside network, then save all settings.

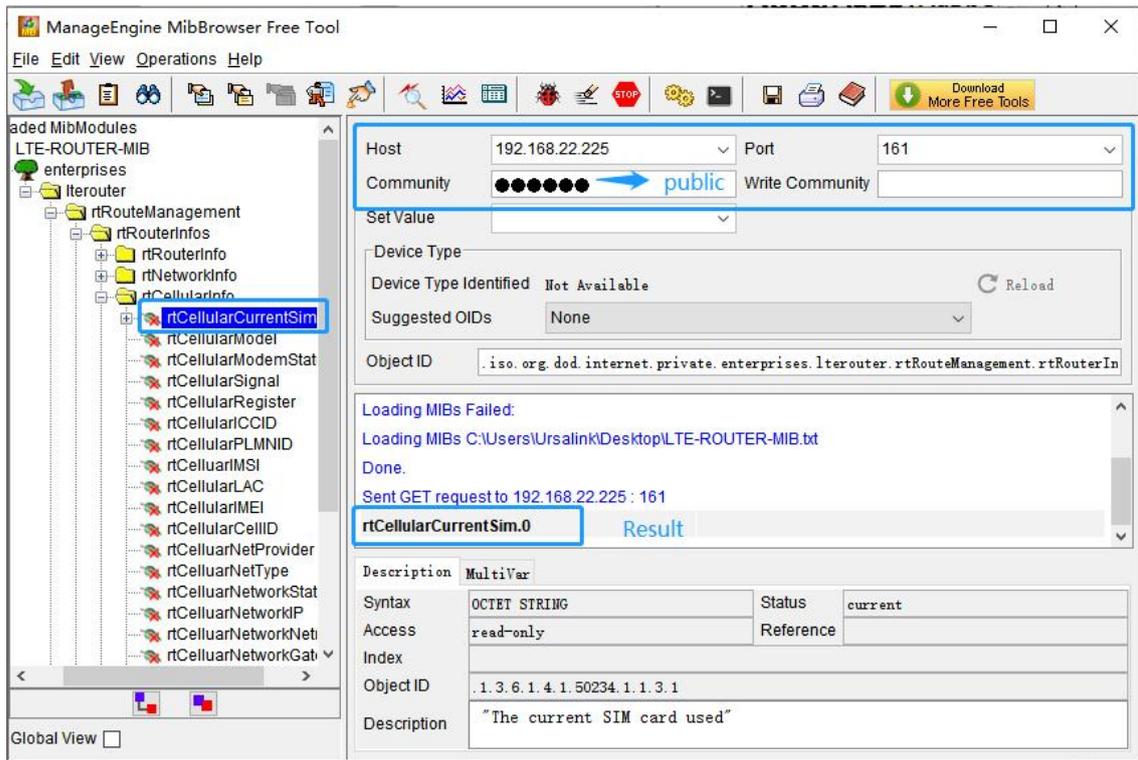

SNMP MIB View VACM Trap MIB

SNMP v1 & v2 User List

Community	Permission	MIB View	Network	Operation
<input type="text" value="public"/>	<input type="text" value="Read-Write"/>	<input type="text" value="cellular"/>	<input type="text" value="0.0.0.0/0"/>	<input type="button" value="x"/> <input type="button" value="+"/>

6. Go to MibBrowser, enter host IP address, port and community. Right click **usCellular CurrentSim** and then click **FET**. Then you will get the current SIM info on the result box. You can get other

cellular info in the same way.

4.7 VRRP Application Example

Application Example

A Web server requires Internet access through the UR32L router. To avoid data loss caused by router breakdown, two UR32L routers can be deployed as VRRP backup group, so as to improve network reliability.

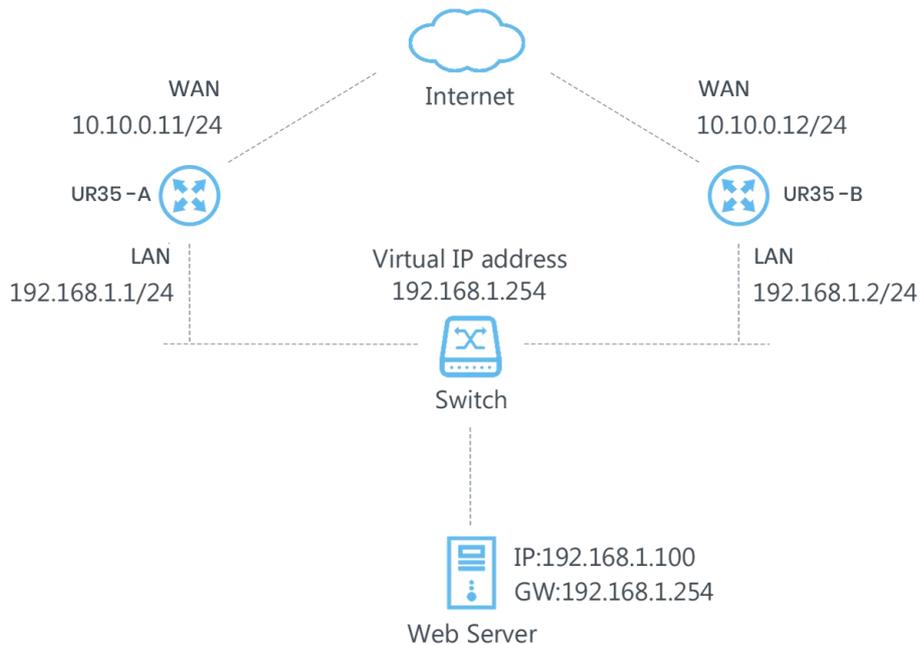

VRRP group:

WAN ports of the UR32L Router A and Router B are connected to the Internet via wired network. And LAN ports of them are connected to a switch.

Virtual IP is 192.168.1.254/24.

Router	Virtual Router ID (Same for A and B)	Port connected with switch	LAN IP Address	Priority	Preemption Mode
A	1	LAN2	192.168.1.1	110	Enable
B	1	LAN2	192.168.1.2	100	Disable

Refer to the topological below.

Configuration Steps

Router A Configuration

1. Go to **Network > Interface > WAN** and configure wired WAN connection as below.

Link Failover	Cellular	Port	WAN	Bridge
WAN Settings				
— WAN_1				
Enable	<input checked="" type="checkbox"/>			
Port	LAN1/WAN			
Connection Type	Static IP			
IPv4 Address	10.10.0.11			
Netmask	255.255.255.0			
IPv4 Gateway	10.10.0.1			
IPv6 Address	fe80::26e1:24ff:fe0:3192			
Prefix-length	64			
IPv6 Gateway				
MTU	1500			
Primary DNS	8.8.8.8			
Secondary DNS				
Enable NAT	<input checked="" type="checkbox"/>			

2. Go to **Network > VRRP > VRRP** and configure VRRP parameters as below.

VRRP

VRRP Status

Status DISABLE

VRRP Settings

Enable

Interface Bridge0 ▾

Virtual Router ID 1

Virtual IP 192.168.1.254

Priority 110

Advertisement Interval (s) 1

Preemption Mode

IPv4 Primary Server 8.8.8.8

IPv4 Secondary Server 114.114.114.114

Interval 300 s

Retry Interval 5 s

Timeout 3 s

Max Ping Retries 3

Router B Configuration

1. Go to **Network > Interface > WAN** and configure wired WAN connection as below.

Link Failover Cellular Port **WAN** Bridge

WAN Settings

— WAN_1

Enable

Port LAN1/WAN

Connection Type Static IP ▾

IPv4 Address 10.10.0.12

Netmask 255.255.255.0

IPv4 Gateway 10.10.0.1

IPv6 Address fe80::26e1:24ff:fe0:3192

Prefix-length 64

IPv6 Gateway

MTU 1500

Primary DNS 8.8.8.8

Secondary DNS

Enable NAT

2. Go to **Network > VRRP > VRRP** and configure VRRP parameters as below.

VRRP

Status DISABLE

VRRP Settings

Enable

Interface Bridge0 ▾

Virtual Router ID 1

Virtual IP 192.168.1.254

Priority 100

Advertisement Interval (s) 1

Preemption Mode

IPv4 Primary Server 8.8.8.8

IPv4 Secondary Server 114.114.114.114

Interval 300 s

Retry Interval 5 s

Timeout 3 s

Max Ping Retries 3

Once you complete all configurations, click **Apply** button on the top-right corner to make changes take effect.

Result: normally, A is the master router, used as the default gateway. When the power of Router A is down or Router A suffers from failure, Router B will become the master router, used as the default gateway. With Preemption Mode enabled, Router A will be master and Router B will demote back to be the backup once Router A can access the Internet again.

4.8 QoS Application Example

Example

Configure the UR32L router to distribute local preference to different FTP download channels. The total download bandwidth is 75000 kbps.

Note: the “Total Download Bandwidth” should be less than the real maximum bandwidth of WAN or cellular interface.

FTP Server IP & Port	Percent	Max Bandwidth(kbps)	Min Bandwidth(kbps)
110.21.24.98:21	40%	30000	25000
110.32.91.44:21	60%	45000	40000

Configuration Steps

1. Go to **Network > QoS > QoS(Download)** to enable QoS and set the total download bandwidth.

Download Bandwidth

Enable

Default Category

Download Bandwidth kbits/s

Capacity

2. Click “**+**” to set up service classes.

Note: the percents must add up to 100%.

Service Category

Name	Percent(%)	Max BW(kbps)	Min BW(kbps)	Operation
<input type="text" value="1"/>	<input type="text" value="40"/>	<input type="text" value="30000"/>	<input type="text" value="25000"/>	<input type="button" value="X"/>
<input type="text" value="2"/>	<input type="text" value="60"/>	<input type="text" value="45000"/>	<input type="text" value="40000"/>	<input type="button" value="X"/>
				<input type="button" value="+"/>

3. Click “**+**” to set up service category rules.

Service Category Rules

Name	Source IP	Source Port	Destination IP	Destination Port	Protocol	Service Category	Operation
<input type="text" value="ftp1"/>	<input type="text" value="110.21.24.98"/>	<input type="text" value="21"/>	<input type="text"/>	<input type="text"/>	<input type="text" value="ANY"/>	<input type="text" value="1"/>	<input type="button" value="X"/>
<input type="text" value="ftp2"/>	<input type="text" value="110.32.91.44"/>	<input type="text" value="21"/>	<input type="text"/>	<input type="text"/>	<input type="text" value="ANY"/>	<input type="text" value="2"/>	<input type="button" value="X"/>
							<input type="button" value="+"/>

Note:

IP/Port: null refers to any IP address/port.

Click **Save** and **Apply** button.
